August 10, 2022

## Abstract

Section 1 provides the formal results supporting the analytical framework of the paper. Section 2 demonstrates that in all of the simulations, conditions (b)-(d) of Definition 1 are satisfied. Section 3 shows supplementary figures for the main simulations in the paper. Sections 4-7 present the results of the robustness checks.

# 1 Formal Results

The formal results below support the analytical conclusions of the main paper, and are straightforward extensions of the formal presentation in Cogliano et al. [1]. The formal presentation below explores implications of Definition A.1 and equation (6) of the main paper, as well as further characterising the notion of equilibrium in Definition A.1. Lemma 1 proves that if the interest rate is strictly positive, then all wealth is used productively and if the wage rate is above the minimum standard  $b$ , then the labour constraint (3) binds for all agents at the solution to  $MP_t^\nu$ .

As in the main paper, let  $E(\mathcal{N}, (A, L), b, (l^\nu)_{\nu \in \mathcal{N}}, (\omega_0^\nu)_{\nu \in \mathcal{N}})$  denote the basic economy defined by the set of countries  $\mathcal{N}$ , technology  $(A, L)$ , consumption bundle  $b$ , labour endowments,  $(l^\nu)_{\nu \in \mathcal{N}}$ , and initial capital endowments  $(\omega_0^\nu)_{\nu \in \mathcal{N}}$ , with  $E_0$  as a shorthand notation.

**Lemma 1.** *Let  $(1, r)$  be a RS for  $E_0$ . At any  $t$ : if  $r_t > 0$ , then  $A(x_t^\nu) + z_t^\nu = \omega_{t-1}^\nu$ , all  $\nu \in \mathcal{N}$ ; and if  $\widehat{w}_t > b$ , then  $L(x_t^\nu + y_t^\nu) = l^\nu$ , all  $\nu \in \mathcal{N}$ .*

*Proof.* By equation (6), if  $r_t > 0$ , but  $A(x_t^\nu) + z_t^\nu < \omega_{t-1}^\nu$ , some  $\nu \in \mathcal{N}$ , then  $\nu$  can increase  $z_t^\nu$  and capital accumulation, contradicting optimality. Similarly, if  $\widehat{w}_t > b$  and  $L(x_t^\nu + y_t^\nu) < l^\nu$ ,  $\nu \in \mathcal{N}$ , then  $\nu$  can increase  $x_t^\nu + y_t^\nu$  and capital accumulation, contradicting optimality. ■

Next, it is possible to derive an explicit expression for the value of  $MP_t^\nu$  and for the growth rate of capital,  $g_t^\nu$ , for all agents.

**Lemma 2.** *Let  $(1, r)$  be a RS for  $E_0$ . Then  $V_t^\nu(\omega_{t-1}^\nu; (1, r_t)) = (1 + r_t)\omega_{t-1}^\nu + (\widehat{w}_t - b)l^\nu$ , and  $g_t^\nu = r_t + (\widehat{w}_t - b)\frac{l^\nu}{\omega_{t-1}^\nu}$ , for all  $\nu \in \mathcal{N}$ .*

*Proof.* Straightforward from equation (6). ■

Lemma 2 has some interesting implications concerning the dynamics of accumulation. Let  $r^{\max} \equiv \frac{1-A-bL}{A}$ . Firstly, at all  $t$ , the aggregate growth rate of the economy is  $g_t = r_t + (\widehat{w}_t - b)\frac{l}{\omega_{t-1}}$ . Hence, if  $l = LA^{-1}\omega_{t-1}$ , then  $g_t = r^{\max}$ , and if  $\widehat{w}_t = b$ , then  $g_t^\nu = g_t = r^{\max}$ , for all  $\nu \in \mathcal{N}$  such that  $\omega_{t-1}^\nu > 0$ . Secondly, if  $\widehat{w}_t > b$ , then for any  $\nu, \mu \in \mathcal{N}$ ,  $g_t^\nu > g_t^\mu$  if and only if  $\frac{l^\nu}{\omega_{t-1}^\nu} > \frac{l^\mu}{\omega_{t-1}^\mu}$ . Finally, if  $r_t = 0$  then  $g_t^\nu = \frac{(1-vb)}{v}\frac{l^\nu}{\omega_{t-1}^\nu}$ , for all  $\nu \in \mathcal{N}$  such that  $\omega_{t-1}^\nu > 0$ , and  $g_t = \frac{(1-vb)}{v}\frac{l}{\omega_{t-1}}$ . Therefore, if there exists  $t' \geq 1$  such that  $r_t = 0$  for all  $t \geq t'$ , then the growth rate of the basic economy decreases over time and tends asymptotically to zero.

Lemma 3 derives a useful property of the set of solutions of  $MP_t^\nu$ .

**Lemma 3.** *Let  $(1, r)$  be a given price vector such that  $r_t \geq 0$  and  $\widehat{w}_t \geq b$ , some  $t$ . If  $\xi_t^\nu$  solves  $MP_t^\nu$ , then  $\xi_t'^\nu \in \mathbb{R}_+^4$  also solves  $MP_t^\nu$  whenever  $x_t'^\nu + y_t'^\nu = x_t^\nu + y_t^\nu$  and  $z_t'^\nu - Ay_t'^\nu = z_t^\nu - Ay_t^\nu$ .*

*Proof.* It is easy to check that  $\xi_t'^\nu$  satisfies constraints (1)-(3). Moreover, labour performed is the same in  $\xi_t^\nu$  and  $\xi_t'^\nu$ . Then the result follows from equation (6). ■

Lemma 3 implies that if  $(x_t^\nu; y_t^\nu; z_t^\nu; \delta_t^\nu)$  solves  $MP_t^\nu$ , then there is another vector  $(0; y_t'^\nu; z_t'^\nu; \delta_t^\nu)$  which solves  $MP_t^\nu$ . In the simulations, this allows us to select one of the many potential solutions of  $MP_t^\nu$  by setting  $x_t^\nu = 0$  for all  $\nu \in \mathcal{N}$ .

Theorem 1 characterises the equilibrium of the economy.

**Theorem 1.** Let  $((\mathbf{1}, r), (\xi^\nu)_{\nu \in \mathcal{N}})$  be a RS for  $E_0$ . At any  $t$ :

- (i) If  $r_t > 0$  and  $\widehat{w}_t > b$ , then  $l = LA^{-1}\omega_{t-1}$ ;
- (ii) If  $l > LA^{-1}\omega_{t-1} > 0$  then  $\widehat{w}_t = b$ ;
- (iii) If  $l < LA^{-1}\omega_{t-1}$  then  $r_t = 0$ .

*Proof.* Part (i). By Lemma 1,  $A(x_t^\nu) + z_t^\nu = \omega_{t-1}^\nu$  and  $L(x_t^\nu + y_t^\nu) = l^\nu$ , for all  $\nu \in \mathcal{N}$ . Therefore,  $A(x_t) + z_t = \omega_{t-1}$  and  $L(x_t + y_t) = l$ . By Definition A.1(c),  $A(x_t + y_t) = \omega_{t-1}$ . Since  $(x_t + y_t) = A^{-1}\omega_{t-1}$ , we have  $L(x_t + y_t) = LA^{-1}\omega_{t-1} = l$ . To prove the second part of the statement, take any  $(1, \widehat{w}'_t)$  such that  $r'_t \geq 0$  and  $\widehat{w}'_t \geq b$ . Then, it is immediate to show that  $\xi_t^\nu$  solves  $MP_t^\nu$  at  $(1, \widehat{w}'_t)$  for all  $\nu$  and  $(\xi_t^\nu)_{\nu \in \mathcal{N}}$  satisfies conditions (b)-(d) of Definition A.1 by assumption.

Part (ii). Suppose, contrary to the statement, that  $\widehat{w}_t > b$ . Then, for all  $\nu \in \mathcal{N}$ , by (2),  $Ax_t^\nu + z_t^\nu \leq \omega_{t-1}^\nu$  and by Lemma 1,  $L(x_t^\nu + y_t^\nu) = l^\nu$ . But, since  $l > LA^{-1}\omega_{t-1}$ ,  $Ay_t < z_t$  holds, contradicting Definition A.1(c). Therefore  $\widehat{w}_t = b$ .

Part (iii). Suppose, contrary to the statement, that  $r_t > 0$ . Then, for all  $\nu \in \mathcal{N}$ , by (3),  $L(x_t^\nu + y_t^\nu) \leq l^\nu$  and by Lemma 1,  $Ax_t^\nu + z_t^\nu = \omega_{t-1}^\nu$ . But, since  $l < LA^{-1}\omega_{t-1}$ ,  $Ay_t > z_t$  holds, contradicting Definition A.1(c). Therefore  $r_t = 0$ . ■

Theorem 2 characterises the exploitation status of every country, based on their wealth per unit of labour performed:

**Theorem 2.** Let  $(\mathbf{1}, r)$  be a RS for  $E_0$ . At any  $t$ , if  $r_t > 0$ :

- (i) country  $\nu$  is an exploiter if and only if  $\frac{W_{t-1}^\nu}{\Lambda_t^\nu} > \frac{1}{r_t} \frac{[1-\widehat{w}_t v]}{v}$ ;
- (ii) country  $\nu$  is exploited if and only if  $\frac{W_{t-1}^\nu}{\Lambda_t^\nu} < \frac{1}{r_t} \frac{[1-\widehat{w}_t v]}{v}$ ;

*Proof.* Because,  $V_t^\nu(W_{t-1}^\nu; (1, \widehat{w}_t)) = (1 + r_t) W_{t-1}^\nu + (\widehat{w}_t - b) l^\nu$ , it follows that  $c_t^\nu = r_t W_{t-1}^\nu + (\widehat{w}_t - b) l^\nu + b \Lambda_t^\nu$ , for all  $t$  and all  $\nu \in \mathcal{N}$ . Therefore for any  $\widehat{w}_t \geq b$ ,  $c_t^\nu = r_t W_{t-1}^\nu + \widehat{w}_t \Lambda_t^\nu$ , for all  $t$  and all  $\nu \in \mathcal{N}$ . But then country  $\nu$  is an exploiter if and only if  $v(r_t W_{t-1}^\nu + \widehat{w}_t \Lambda_t^\nu) > \Lambda_t^\nu$ , and the first part of the statement follows from simple algebraic manipulations. The other part follows in like manner. ■

Theorem 3 characterises the class structure of the world economy.

**Theorem 3.** Let  $(\mathbf{1}, \widehat{w})$  be a RS for  $E_0$ . At any  $t$ , if  $r_t > 0$ :

- (i)  $\nu \in (+, 0, +) \setminus (+, 0, 0)$  if and only if  $Ay_t^\nu < z_t^\nu$  for all  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$ ;
- (ii)  $\nu \in (+, 0, 0)$  if and only if  $Ay_t^\nu = z_t^\nu$  for some  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$ ;
- (iii)  $\nu \in (+, +, 0) \setminus (+, 0, 0)$  if and only if  $Ay_t^\nu > z_t^\nu$  for all  $\xi_t^\nu \in \mathcal{A}^\nu(1, \widehat{w}_t)$ ;
- (iv)  $\nu \in (0, +, 0)$  if and only if  $W_{t-1}^\nu = 0$ .

*Proof.* 1. If  $r_t > 0$ , then by Lemma 1, for all  $\nu \in \mathcal{N}$ ,  $A(x_t^\nu) + z_t^\nu = \omega_{t-1}^\nu$  for all  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$ . Therefore  $\nu \in (0, +, 0)$  implies  $W_{t-1}^\nu = 0$ . Conversely, it is easy to see that for all  $\widehat{w}_t \geq b$ , if  $W_{t-1}^\nu = 0$ , then  $\nu \in (0, +, 0)$ .

2. Consider agents with  $W_{t-1}^\nu > 0$ . By the convexity of  $MP_t^\nu$ , if  $Ay_t^\nu < z_t^\nu$  for some  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$  and  $Ay_t^{\prime\nu} > z_t^{\prime\nu}$  for some  $\xi_t^{\prime\nu} \in \mathcal{A}^\nu(1, r_t)$ , then there is  $\xi_t^{\prime\prime\nu} \in \mathcal{A}^\nu(1, r_t)$  such that  $Ay_t^{\prime\prime\nu} = z_t^{\prime\prime\nu}$ . Therefore, for all agents with  $W_{t-1}^\nu > 0$ : either  $Ay_t^\nu < z_t^\nu$  for all

$\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$ ; or  $Ay_t^\nu > z_t^\nu$  for all  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$ ; or  $Ay_t^\nu = z_t^\nu$  for some  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$ . The latter are mutually exclusive and exhaustive cases.

3. Part (i). Suppose  $Ay_t^\nu < z_t^\nu$  for all  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$ . We consider two cases.

Case 1:  $\widehat{w}_t > b$ . By Lemma 1, at all  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$ , it must be  $Ax_t^\nu + z_t^\nu = \omega_{t-1}^\nu$  and  $L(x_t^\nu + y_t^\nu) = l^\nu$ . From the latter equations, it follows that  $LA^{-1}z_t^\nu - Ly_t^\nu = LA^{-1}\omega_{t-1}^\nu - l^\nu$ . Since  $Ay_t^\nu < z_t^\nu$  for all  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$ , then  $LA^{-1}\omega_{t-1}^\nu > l^\nu$ .

Consider  $\xi_t^{\prime\nu} = (x_t^{\prime\nu}; 0; z_t^{\prime\nu}; 0)$  such that  $Lx_t^{\prime\nu} = l^\nu$ , and  $x_t^{\prime\nu} + y_t^{\prime\nu} = x_t^\nu + y_t^\nu$ . Note that  $z_t^{\prime\nu} = z_t^\nu - Ay_t^\nu > 0$  and so noting that  $z_t^{\prime\nu} - Ay_t^{\prime\nu} = z_t^\nu - Ay_t^\nu$ , by Lemma 3 it follows that  $\xi_t^{\prime\nu} \in \mathcal{A}^\nu(1, r_t)$ . Hence,  $\nu \in (+, 0, +)$ .

It remains to show that  $\nu \notin (+, 0, 0)$ . Suppose, by way of contradiction, that there is  $\xi_t^\nu = (x_t^\nu; 0; 0; 0) \in \mathcal{A}^\nu(1, r_t)$ . Since  $r_t > 0$ , then by Lemma 1,  $Ax_t^\nu = \omega_{t-1}^\nu$  and so  $Lx_t^\nu = LA^{-1}\omega_{t-1}^\nu > l^\nu$ , which violates the labour constraint.

Case 2:  $\widehat{w}_t = b$ . In this case, any  $\xi_t^\nu$  such that  $\delta_t^\nu = 0$ ,  $Ax_t^\nu + z_t^\nu = \omega_{t-1}^\nu$ , and  $L(x_t^\nu + y_t^\nu) \leq l^\nu$ , solves  $MP_t^\nu$ . Therefore, it is immediate to see that  $\nu \in (+, 0, +)$ . Further,  $\xi_t^\nu = (0; L^{-1}l^\nu; \omega_{t-1}^\nu; 0) \in \mathcal{A}^\nu(1, r_t)$ , and therefore  $Ay_t^\nu < z_t^\nu$  for all  $\xi_t^\nu \in \mathcal{A}^\nu(1, r_t)$  implies  $LA^{-1}\omega_{t-1}^\nu > l^\nu$ . Hence the same argument as in Case 1 can be used to prove  $\nu \notin (+, 0, 0)$ .

4. Parts (ii) and (iii) are proved similarly.  $\blacksquare$

Theorem 3 provides a complete partition of countries into classes, based on their status in the international credit market. An immediate implication of Theorem 3 is that the class status of each country is related to its productive endowments: countries with higher (lower) wealth per capita will belong to the higher (lower) echelons of the class hierarchy.

**Corollary 1.** Let  $(\mathbf{1}, r)$  be a RS for  $E_0$ . Consider any  $t$ , such that  $r_t > 0$ . Then,  $\nu \in C_t^1$  if and only if  $LA^{-1}\omega_{t-1}^\nu > l^\nu$  and  $\nu \in C_t^4$  if and only if  $W_{t-1}^\nu = 0$ . Furthermore, if  $\widehat{w}_t > b$ , then  $\nu \in C_t^2$  if and only if  $LA^{-1}\omega_{t-1}^\nu = l^\nu$  and  $\nu \in C_t^3$  if and only if  $LA^{-1}\omega_{t-1}^\nu < l^\nu$ ; whereas if  $\widehat{w}_t = b$ , then  $\nu \in C_t^2$  if and only if  $LA^{-1}\omega_{t-1}^\nu \leq l^\nu$  and  $C_t^3 = \emptyset$ .

The next result proves that the CECP holds in the world economy: countries that hold a privileged position in the credit market are exploiters, while net borrowers are exploited.

**Theorem 4 (CECP).** Let  $(\mathbf{1}, r)$  be a RS for  $E_0$ . At any  $t$ , such that  $r_t > 0$ , if  $\nu \in C_t^1$  then  $\nu$  is an exploiter and if  $\nu \in C_t^3 \cup C_t^4$  then  $\nu$  is exploited. Furthermore, if  $\widehat{w}_t > b$  then:

- (i)  $\nu \in C_t^1$  if and only if  $\nu$  is an exploiter;
- (ii)  $\nu \in C_t^2$  if and only if  $\nu$  is neither exploited nor an exploiter;
- (iii)  $\nu \in C_t^3 \cup C_t^4$  if and only if  $\nu$  is exploited.

*Proof.* 1. If  $\widehat{w}_t > b$ , then the result follows immediately from Corollary 1 and Theorem 2, noting that by Lemma 1,  $\Lambda_t^\nu = l^\nu$  and  $\frac{1}{r_t} \frac{[1-\widehat{w}_t v]}{v} = \frac{A}{L}$ .

2. Suppose that  $\widehat{w}_t = b$ . By Corollary 1,  $\nu \in C_t^3 \cup C_t^4 \Leftrightarrow W_{t-1}^\nu = 0$ . Hence by Theorem 2, if  $\Lambda_t^\nu > 0$ , then  $\nu$  is exploited. Further, by Corollary 1,  $\nu \in C_t^1 \Leftrightarrow LA^{-1}\omega_{t-1}^\nu > l^\nu$ . Noting that  $\frac{W_{t-1}^\nu}{\Lambda_t^\nu} \geq \frac{W_{t-1}^\nu}{l^\nu} > \frac{A}{L} = \frac{1}{\pi_t} \frac{[1-\widehat{w}_t v]}{v}$ , the result follows from Theorem 2.  $\blacksquare$

## 2 Equilibrium Conditions

The Figures in this section show that, in all of our simulations, conditions (b)-(d) of Definition 1 in the paper are satisfied, and so we are analysing the equilibrium dynamics of the economies considered.

Figure 1: Equilibrium conditions - Basic model

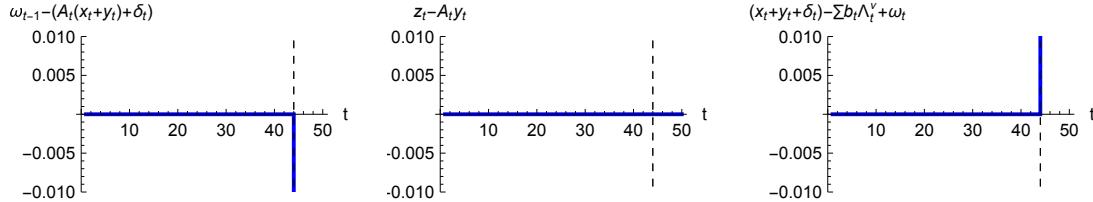

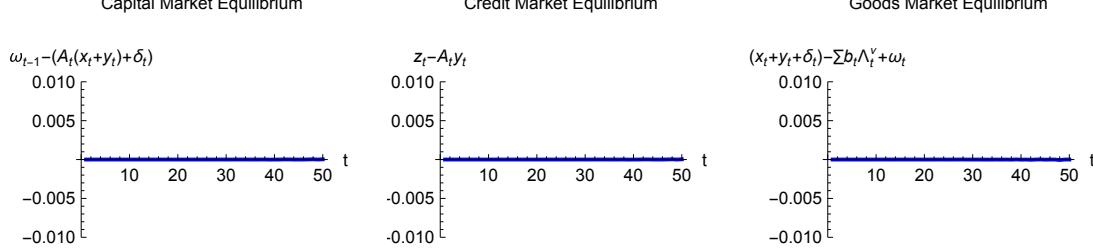

Figure 2: Equilibrium conditions - Model with endogenous subsistence and technical change

### 3 Supplementary Figures for Main Simulations

#### 3.1 Basic model

Figure 3 shows the distribution of income. Figure 3(a) shows the distribution of shares of income over  $t$  and figure 3(b) shows the Gini coefficient of income over  $t$ .

Figure 3: Distribution of Income - Basic Model

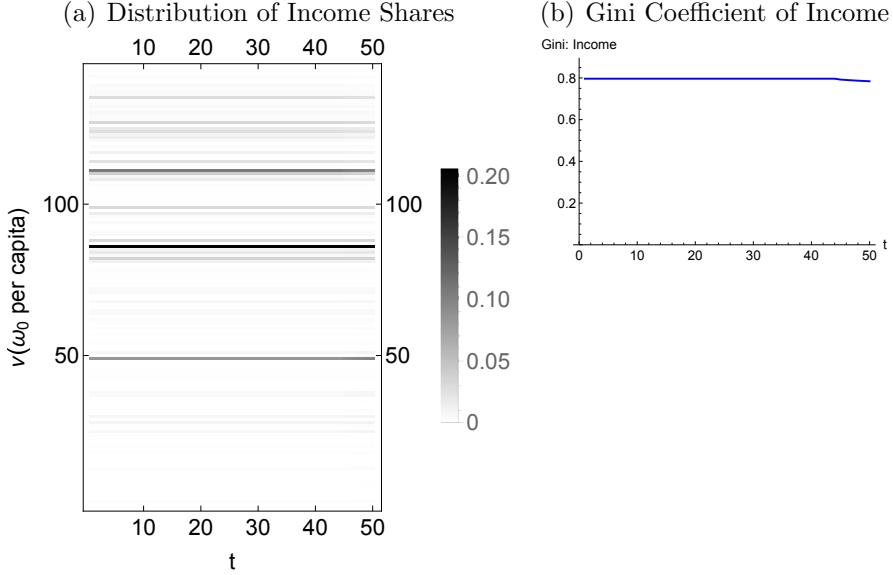

Figure 4 shows additional summary results for the basic model not shown in the main summary results, notably  $x_t$ , aggregate net output  $(1 - A)y_t$ , and net output per capita  $((1 - A)y_t)/N_t$ .

Figure 4: Additional Summary Results - Basic Model

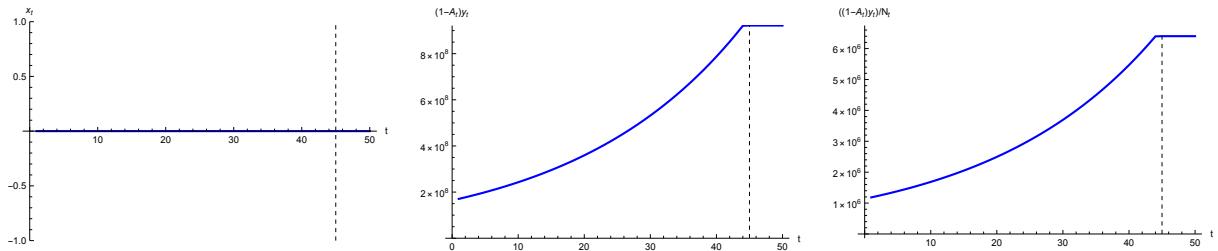

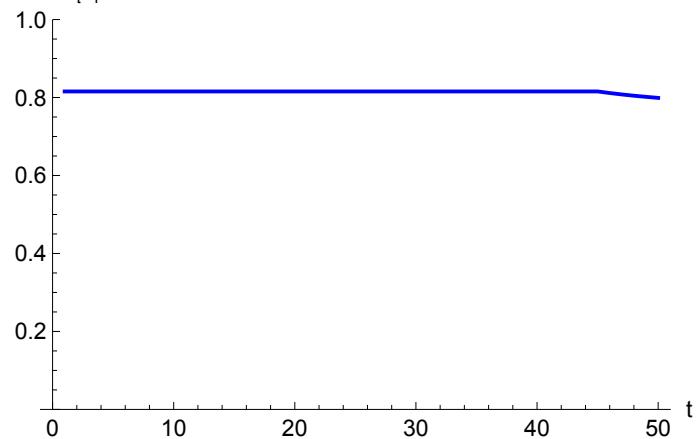

Figure 5 shows the Gini coefficient of the distribution of wealth.

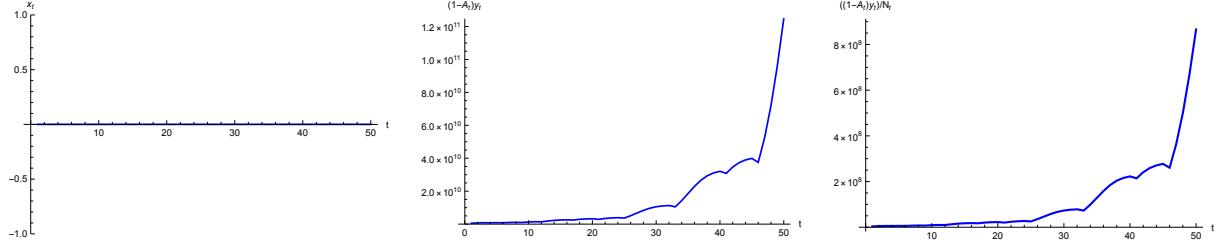

Figure 5: Gini coefficient of wealth - Basic Model  
Gini:  $W_{t-1}^v$

### 3.2 Model with endogenous subsistence and technical change

Figure 6 shows additional summary results for the model with endogenous subsistence and technical change not shown with the main summary results, notably  $x_t$ , aggregate net output  $(1 - A_t)y_t$ , and net output per capita  $((1 - A_t)y_t)/N$ .

Figure 6: Additional Summary Results - Model with endogenous subsistence and technical change

Figures 7(a)-7(b) show the persistence and stability of the basic exploitation and class structure of the economy produced by the introduction of technical change. Figure 7(c) confirms that the CECP continues to hold in the more general case of endogenous consumption and technical change.

Figure 8 shows the Gini coefficient of the distribution of wealth.

Figure 9 shows the distribution of income shares over  $t$  and the Gini coefficient of income.

Figure 7: Class and exploitation status - Model with endogenous subsistence and technical change

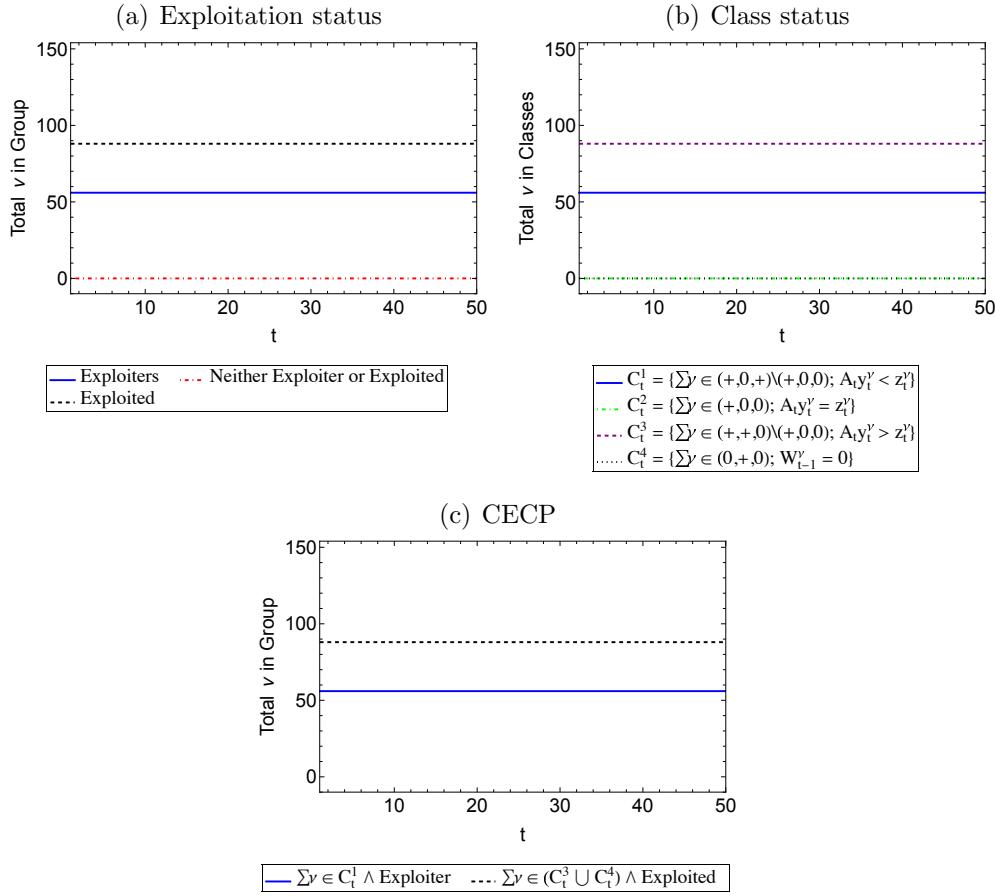

Figure 8: Gini coefficient of wealth - Model with endogenous subsistence and technical change

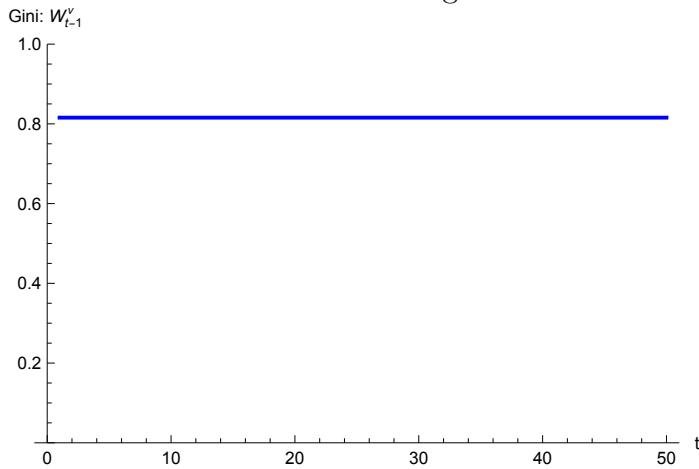

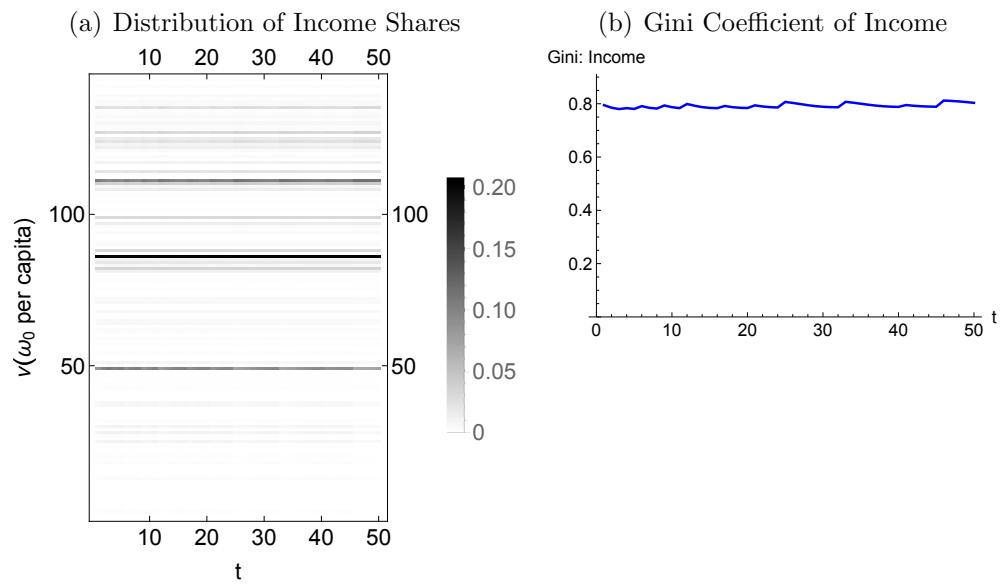

Figure 9: Distribution of Income - Model with endogenous subsistence and technical change

## 4 Heterogeneous Standard of Living Consumption

This section presents results for an extension of the model with endogenous consumption and technical change that incorporates consumption based on a country's standard of living, which can go beyond the subsistence consumption featured in the main simulations. To consume beyond subsistence,  $b_t \Lambda_t^\nu$ , a country needs to consume out of wealth, or at least out of newly generated capital income (or interest revenue) during any  $t$ ,  $r_t \omega_{t-1}^\nu$ . Consumption based on wealth can be thought of as varying across countries depending on differences in standards of living. Standard of living-based consumption can be conceptualised as a function of subsistence  $b_t$  and a country's interest revenue  $r_t \omega_{t-1}^\nu$ :  $D_t^\nu(b_t, \varphi_t)$ , where  $\varphi_t$  is a monotonically increasing function of each country's interest revenue  $r_t \omega_{t-1}^\nu$ .

Implementing this kind of alternative consumption modifies  $MP_t^\nu$  from the main paper. Standard of living-based consumption replaces the  $p_t b_t \Lambda_t^\nu$  expression in the right-hand side of constraint (1) in  $MP_t^\nu$  with  $p_t D_t^\nu$ . This alteration means that agents no longer solve  $MP_t^\nu$ . Instead, they determine  $(x_t^\nu, y_t^\nu, z_t^\nu)$  as in the main paper, but now  $\omega_t^\nu$  is a residual based on  $(x_t^\nu, y_t^\nu, z_t^\nu)$  and  $D_t^\nu$ , i.e. constraint (1) becomes:

$$p_t x_t^\nu + [p_t - (1 + r_t)p_{t-1} A_t] y_t^\nu + (1 + r_t) z_t^\nu + p_t \delta_t^\nu = p_t D_t^\nu + p_t \omega_t^\nu.$$

Four possible versions of  $D_t^\nu$  with different forms of  $\varphi_t$ , or other approaches to incorporating interest revenue into consumption, are examined in the subsections below. All parameters and initial conditions are the same as those for the endogenous subsistence and technical change simulation in the main paper.

### 4.1 Version 1

This subsection examines the case of:

$$D_t^\nu = b_t (\Lambda_t^\nu + \varphi_t (\max\{0, r_t \omega_{t-1}^\nu - b_t \Lambda_t^\nu\})) , \quad (1)$$

where  $\varphi_t$  takes the form:

$$\varphi_t = \begin{cases} \frac{r_t \omega_{t-1}^\nu}{b_t} & \text{if } r_t \omega_{t-1}^\nu - b_t \Lambda_t^\nu > 0 \\ 0 & \text{otherwise} \end{cases} .$$

Figure 10 shows the summary results of the simulation. Figure 11 shows the technology ( $A_t, L_t$ ) and labour values over  $t$ .

Figure 12 shows the composition of exploitation and class status over the course of the simulation. Figures 13(a) and 13(b) show, respectively, the distribution of  $e_t^\nu$  and the Gini coefficient of the distribution of  $e_t^\nu$  over  $t$ .

Figures 14-16 show exploitation intensity versus initial wealth for all countries for select  $t$  to provide a sense of how countries fall into being exploiters or exploited, or how this status may change.

Tables 1 and 2 report  $e_t^\nu$  for countries that begin the simulation as exploiters and exploited, respectively, for the same select  $t$  as figures 14-16. Note that while a country may

begin the simulation as either an exploiter or exploited, given the specification of  $D_t^\nu$ , it is possible that countries shift between exploiter and exploited status over the simulation.

Figures 17 and 18 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

Figure 17: Distribution of wealth - Model with standard of living consumption

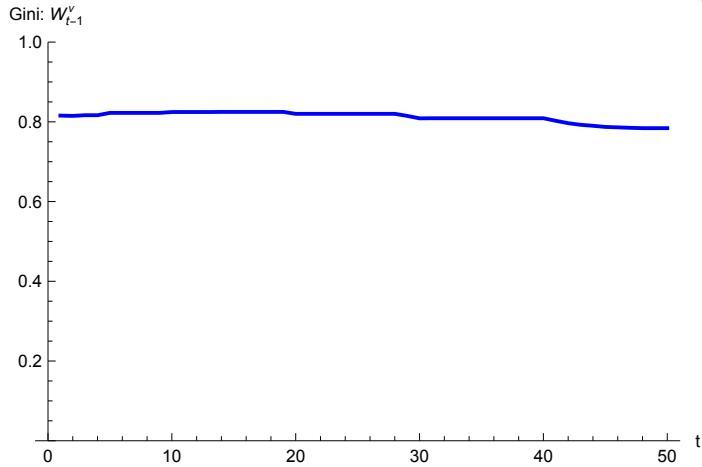

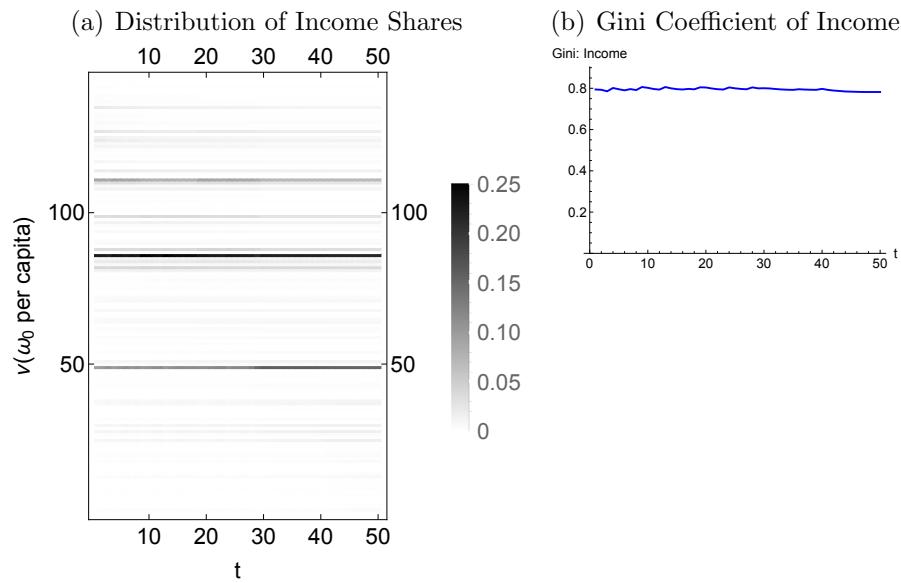

Figure 18: Distribution of Income - Model with standard of living consumption

## 4.2 Version 2

This subsection shows results for the case of:

$$D_t^\nu = b_t \left( 1 + \varphi_t(\max\{0, r_t \omega_{t-1}^\nu - b_t\}) \right), \quad (2)$$

where  $\varphi_t$  takes the form:

$$\varphi_t = \begin{cases} \frac{r_t \omega_{t-1}^\nu}{b_t} & \text{if } r_t \omega_{t-1}^\nu - b_t > 0 \\ 0 & \text{otherwise} \end{cases}.$$

Figure 19 shows the summary results of the simulation. Figure 20 shows the technology  $(A_t, L_t)$  and labour values over  $t$ .

Figure 21 shows the composition of exploitation and class status over the course of the simulation. Figures 22(a) and 22(b) show, respectively, the distribution of  $e_t^\nu$  and the Gini coefficient of the distribution of  $e_t^\nu$  over  $t$ .

Figures 23-25 show exploitation intensity versus initial wealth for all countries for select  $t$  to provide a sense of how countries fall into being exploiters or exploited.

Tables 3 and 4 report  $e_t^\nu$  for countries that begin the simulation as exploiters and exploited, respectively, for the same select  $t$  as figures 23-25.

Figures 26 and 27 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

Figure 19: Summary results - Model with standard of living consumption

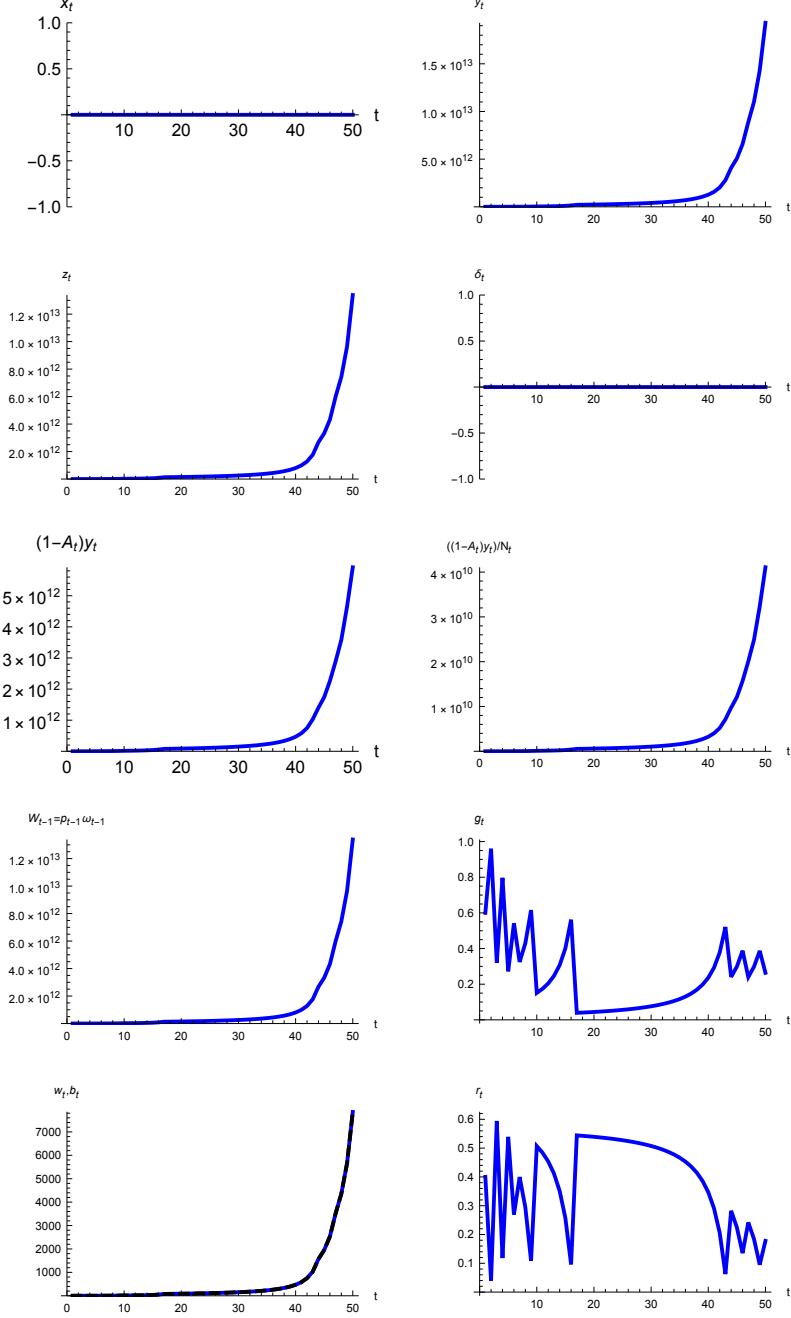

Figure 20:  $A_t$ ,  $L_t$ , and labour values - Model with standard of living consumption

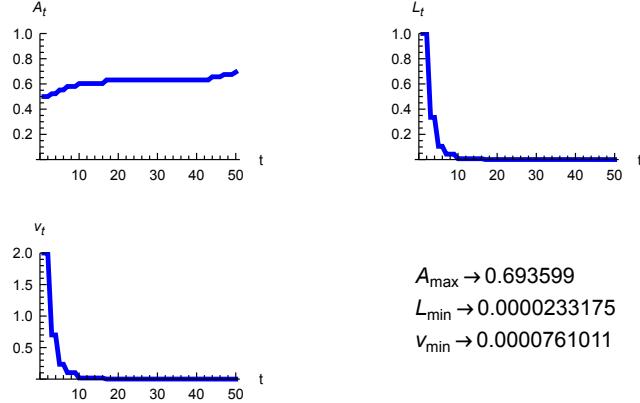

Figure 21: Class and exploitation status - Model with standard of living consumption

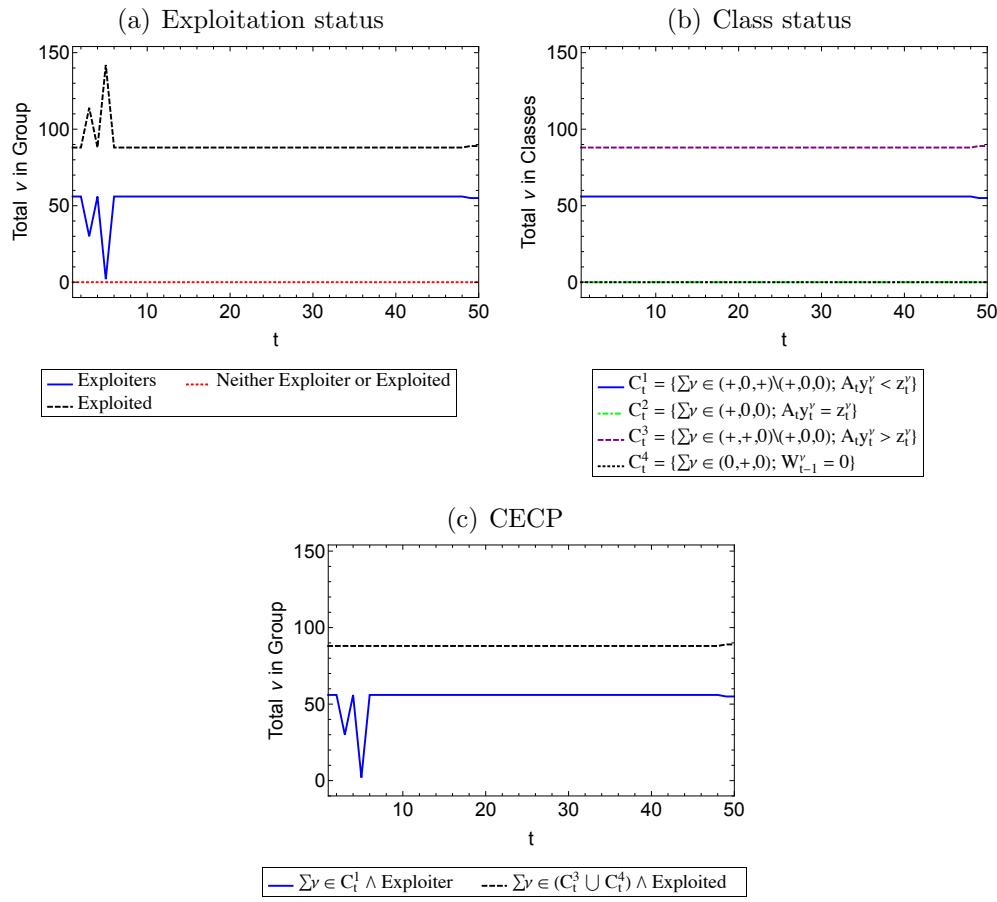

Figure 22: Exploitation intensity index - Model with standard of living consumption

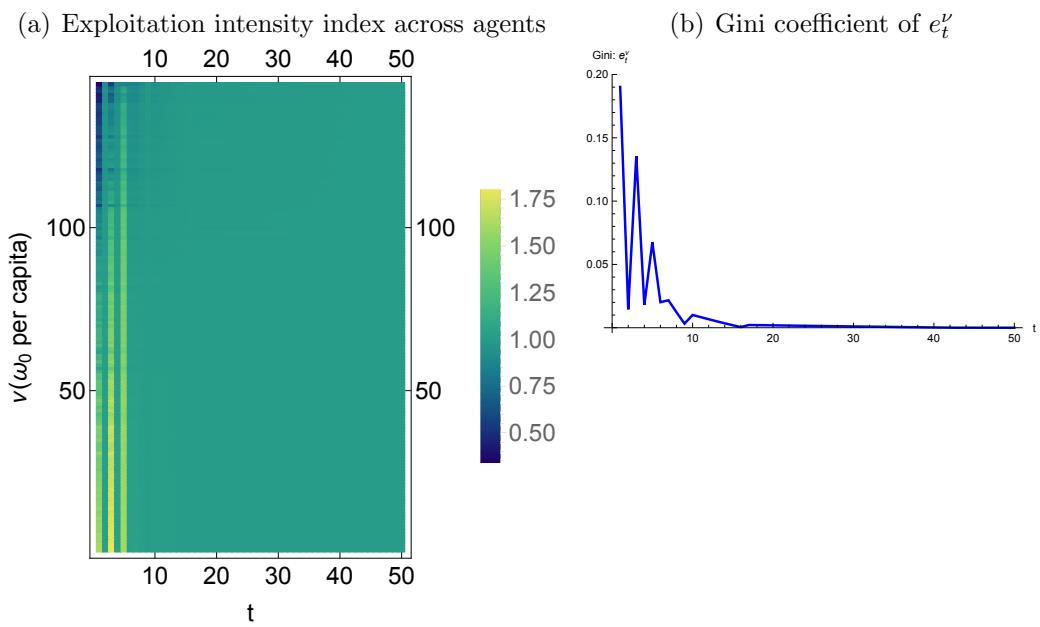

Figure 23: Worldwide Exploitation Intensity - Model with standard of living consumption

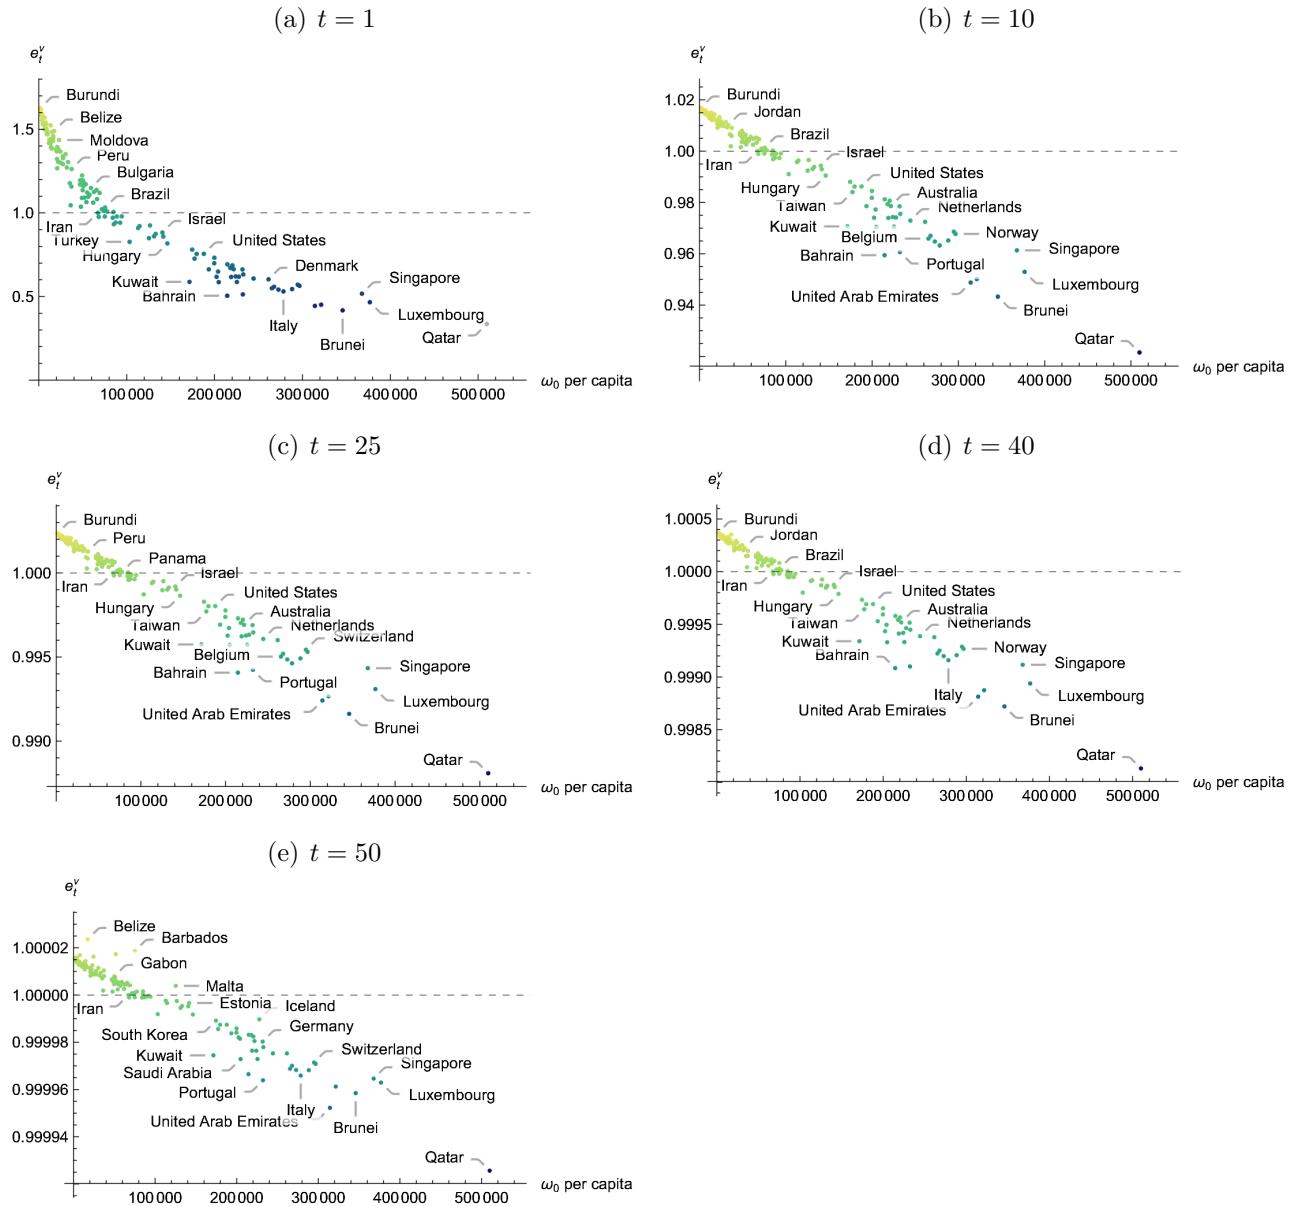

Figure 24: Exploiter Countries - Model with standard of living consumption

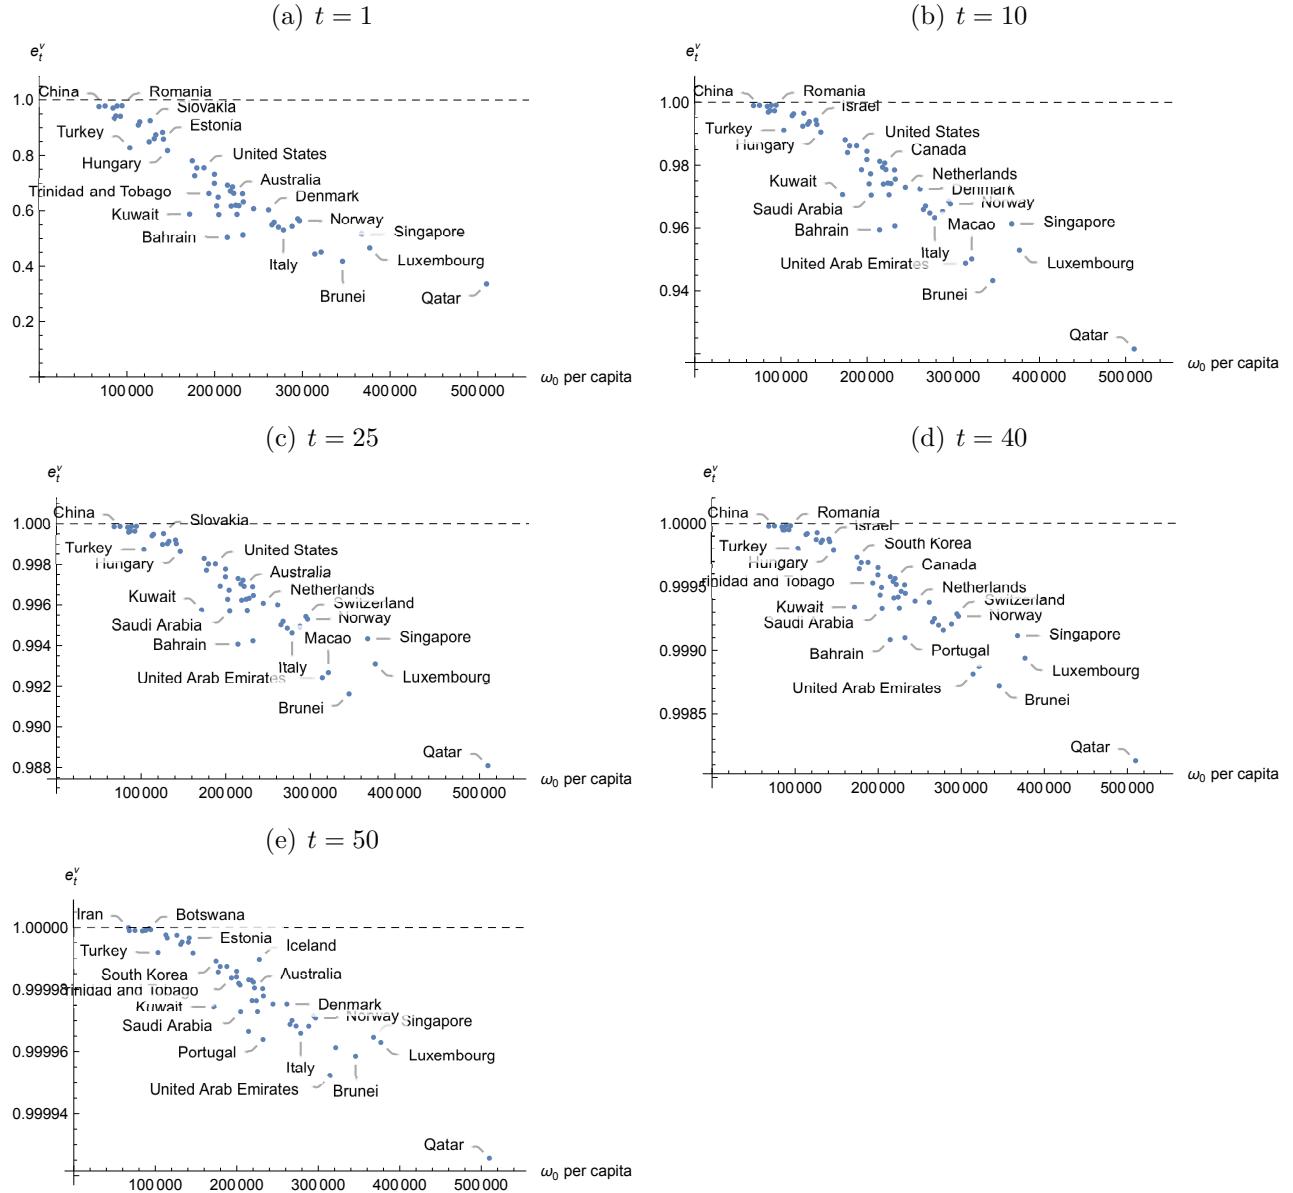

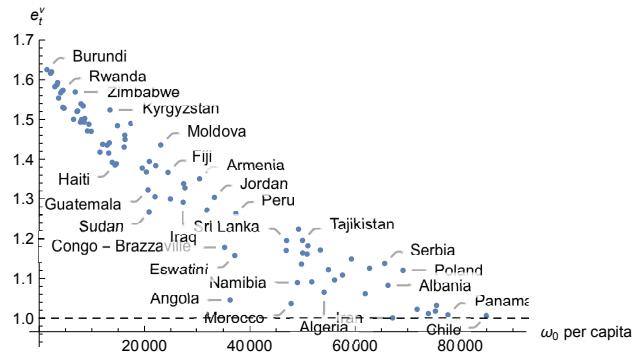

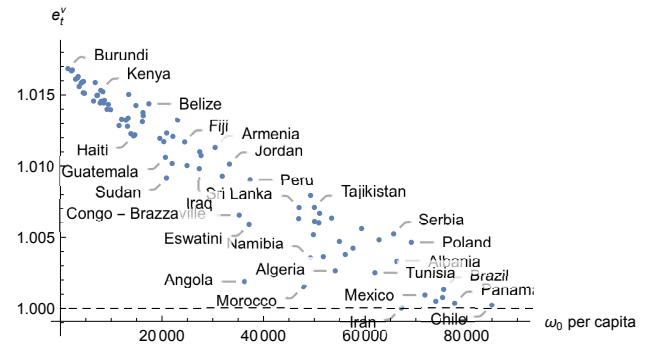

Figure 25: Exploited Countries - Model with standard of living consumption

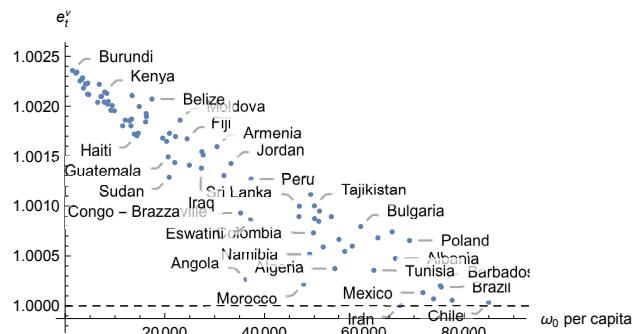

(a)  $t = 1$

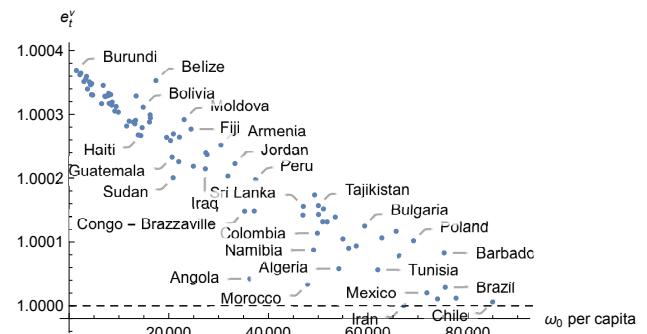

(b)  $t = 10$

(c)  $t = 25$

(d)  $t = 40$

(e)  $t = 50$

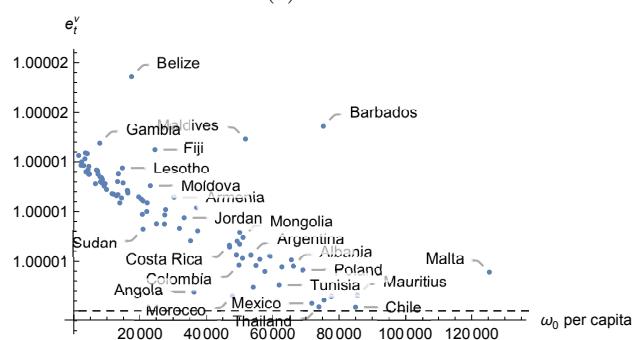

Table 3: Exploitation Intensity for Exploiter Countries at select  $t$  - Model with standard of living consumption

Figure 26: Distribution of wealth - Model with standard of living consumption

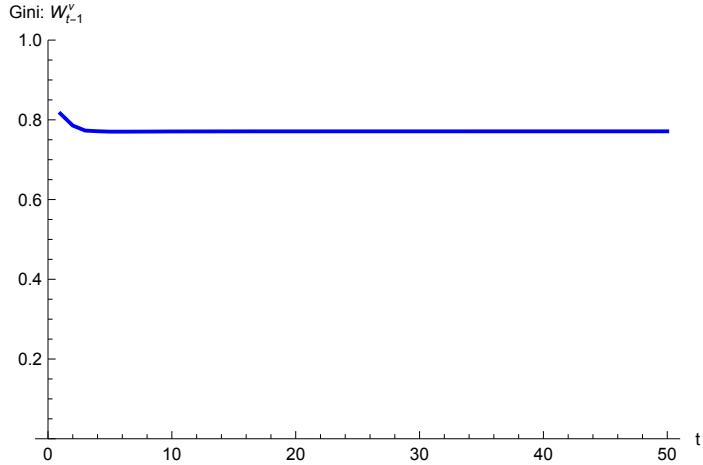

Figure 27: Distribution of Income - Model with standard of living consumption

### 4.3 Version 3

This subsection shows results for the case of:

$$D_t^\nu = b_t \Lambda_t^\nu + \min \left\{ \frac{r_t \omega_{t-1}^\nu}{r_t \omega_0^*}, 1 \right\} r_t \omega_{t-1}^\nu, \quad (3)$$

where  $\omega_0^*$  is a reference capital stock set at the 91st percentile of the initial world capital stock.

Figure 28 shows the summary results of the simulation. Figure 29 shows the technology ( $A_t, L_t$ ) and labour values over  $t$ .

Figure 30 shows the composition of exploitation and class status over the course of the simulation. Figures 31(a) and 31(b) show, respectively, the distribution of  $e_t^\nu$  and the Gini coefficient of the distribution of  $e_t^\nu$  over  $t$ .

Figures 32-34 show exploitation intensity versus initial wealth for all countries for select  $t$  to provide a sense of how countries fall into being exploiters or exploited.

Tables 5 and 6 report  $e_t^\nu$  for countries that begin the simulation as exploiters and exploited, respectively, for the same select  $t$  as figures 32-34.

Figures 35 and 36 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

Figure 35: Distribution of wealth - Model with standard of living consumption

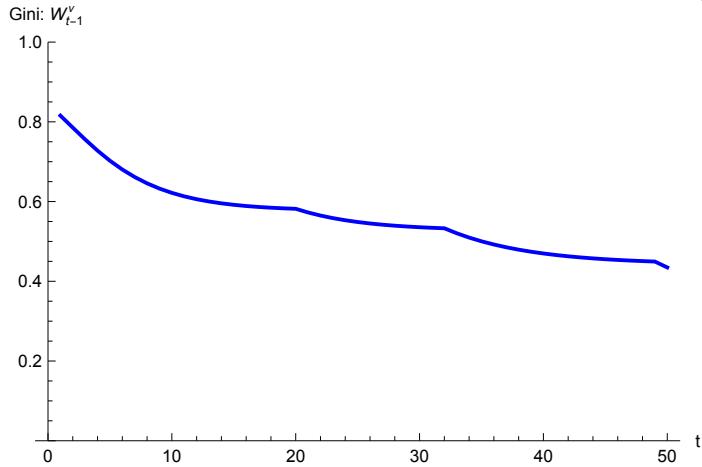

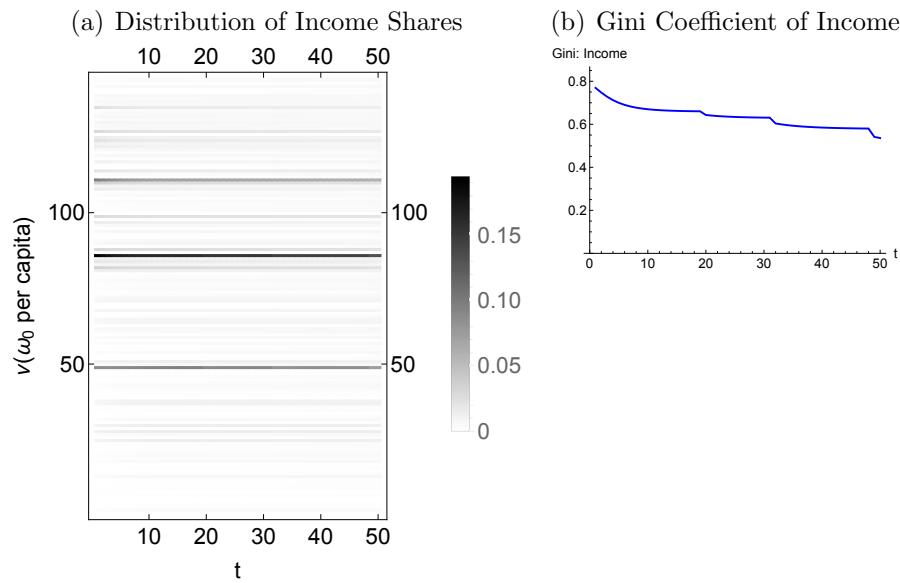

Figure 36: Distribution of Income - Model with standard of living consumption

## 4.4 Version 4

This subsection shows results for the case of:

$$D_t^\nu = b_t \Lambda_t^\nu + \min \left\{ \frac{r_t \omega_{t-1}^\nu}{r_1 \omega_0^*}, 1 \right\} r_t \omega_{t-1}^\nu, \quad (4)$$

where  $\omega_0^*$  is a reference capital stock set at the 91st percentile of the initial world capital stock.

Figure 37 shows the summary results of the simulation. Figure 38 shows the technology ( $A_t, L_t$ ) and labour values over  $t$ .

Figure 39 shows the composition of exploitation and class status over the course of the simulation. Figures 40(a) and 40(b) show, respectively, the distribution of  $e_t^\nu$  and the Gini coefficient of the distribution of  $e_t^\nu$  over  $t$ .

Figures 41-43 show exploitation intensity versus initial wealth for all countries for select  $t$  to provide a sense of how countries fall into being exploiters or exploited.

Tables 7 and 8 report  $e_t^\nu$  for countries that begin the simulation as exploiters and exploited, respectively, for the same select  $t$  as figures 41-43.

Figures 44 and 45 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

Figure 44: Distribution of wealth - Model with standard of living consumption

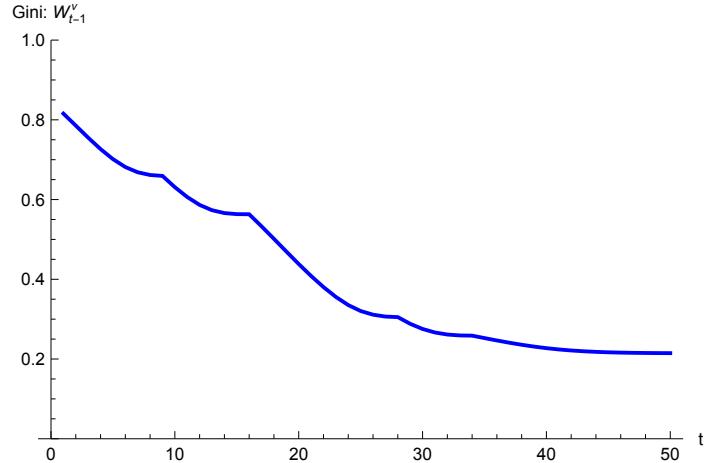

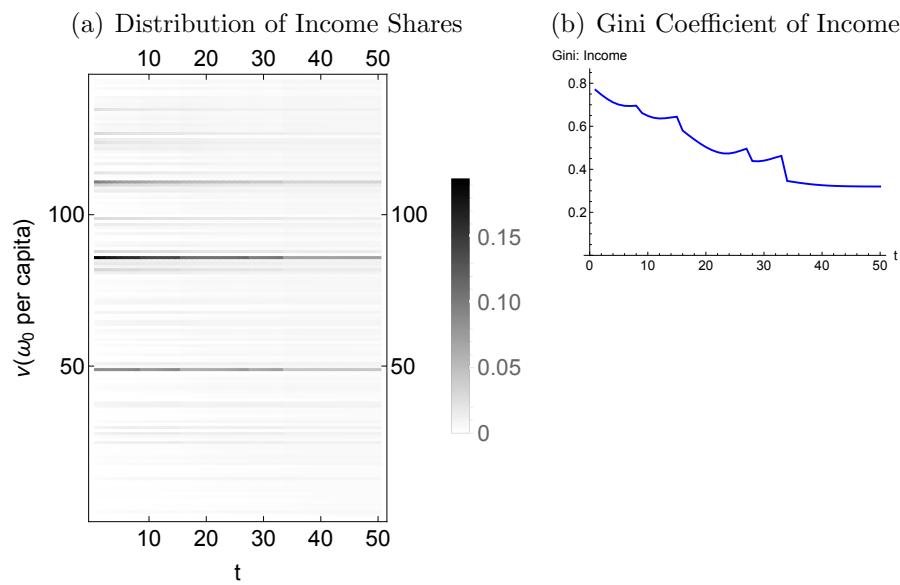

Figure 45: Distribution of Income - Model with standard of living consumption

## 4.5 Version 5

This subsection shows results for the case of:

$$D_t^\nu = b_t \Lambda_t^\nu + \max \left\{ 0, \min \left\{ \frac{r_t \omega_{t-1}^\nu - b_t \Lambda_t^\nu}{r_t \omega_0^* - b_t \Lambda_1^\nu}, 1 \right\} \right\} r_t \omega_{t-1}^\nu, \quad (5)$$

where  $\omega_0^*$  is a reference capital stock set at the 91st percentile of the initial world capital stock and  $\Lambda_1^\nu$  is the initial effective labour performed by a country.

Figure 46 shows the summary results of the simulation. Figure 47 shows the technology ( $A_t, L_t$ ) and labour values over  $t$ .

Figure 48 shows the composition of exploitation and class status over the course of the simulation. Figures 49(a) and 49(b) show, respectively, the distribution of  $e_t^\nu$  and the Gini coefficient of the distribution of  $e_t^\nu$  over  $t$ .

Figures 50-52 show exploitation intensity versus initial wealth for all countries for select  $t$  to provide a sense of how countries fall into being exploiters or exploited.

Tables 9 and 10 report  $e_t^\nu$  for countries that begin the simulation as exploiters and exploited, respectively, for the same select  $t$  as figures 50-52.

Figures 53 and 54 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

Figure 53: Distribution of wealth - Model with standard of living consumption

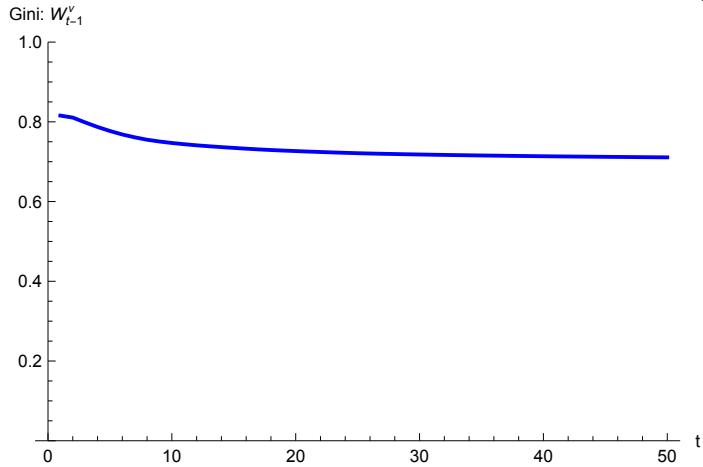

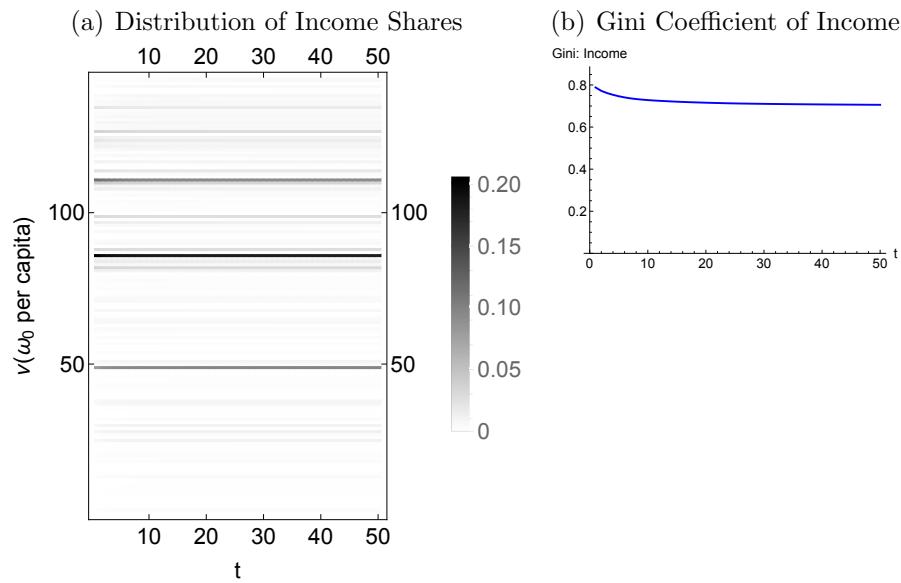

Figure 54: Distribution of Income - Model with standard of living consumption

## 4.6 Version 6

This subsection shows results for the case of:

$$D_t^\nu = \begin{cases} b_t \Lambda_t^\nu + \min \left\{ \frac{r_t \omega_{t-1}^\nu}{r_1 \omega_0^*}, 1 \right\} r_t \omega_{t-1}^\nu & \text{if } r_t \omega_{t-1}^\nu - b_t \Lambda_t^\nu > 0 \\ b_t \Lambda_t^\nu & \text{otherwise} \end{cases}, \quad (6)$$

where  $\omega_0^*$  is a reference capital stock set at the 91st percentile of the initial world capital stock.

Figure 55 shows the summary results of the simulation. Figure 56 shows the technology ( $A_t, L_t$ ) and labour values over  $t$ .

Figure 57 shows the composition of exploitation and class status over the course of the simulation. Figures 58(a) and 58(b) show, respectively, the distribution of  $e_t^\nu$  and the Gini coefficient of the distribution of  $e_t^\nu$  over  $t$ .

Figures 59-61 show exploitation intensity versus initial wealth for all countries for select  $t$  to provide a sense of how countries fall into being exploiters or exploited.

Tables 11 and 12 report  $e_t^\nu$  for countries that begin the simulation as exploiters and exploited, respectively, for the same select  $t$  as figures 59-61.

Figures 62 and 63 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

## 5 Alternative Analysis of Technical Change

In this section, we analyse a variant of the model with exogenous labour-saving technical change and endogenous subsistence. This version of the basic model, starting in a capital-constrained state, incorporates an exogenous, constant rate of technological progress and endogenously determined subsistence. Technological progress is such that  $A_t$  remains constant and  $L_t$  decreases by two percent during each  $t$ . Subsistence  $b_t$  grows at the same rate as the aggregate endowment. The number of agents, the initial distribution of endowments, and all other parameters are handled as in the paper.

The results of the simulation are presented in Figures 64-72(b). Figure 64 presents the summary results. The simulation remains capital constrained for all  $t$ , thus  $\hat{w}_t = b_t$  for all  $t$ . Figure 65 shows  $L_t$  and labour values over the course of the simulation.

Figure 66 shows the exploitation and class status of the agents over the course of the simulation. Both the basic structure of exploitation relations. Because the simulation remains capital constrained, exploitation and classes persist, and, because  $L_{tyt}$  remains constant for all  $t$ , the class structure remains stable over the simulation.

Figure 67(a) shows the stable distribution of  $e_t^\nu$  across agents for all  $t$ . Figure 67(b) shows that the Gini coefficient of  $e_t^\nu$  quickly settles to a stable level over the simulation.

Figures 68-70 show exploitation intensity versus initial wealth for all countries for select  $t$  to provide a sense of how countries fall into being exploiters or exploited.

Tables 13 and 14 report  $e_t^\nu$  for exploiter and exploited countries, respectively, for the same select  $t$  as figures 68-70.

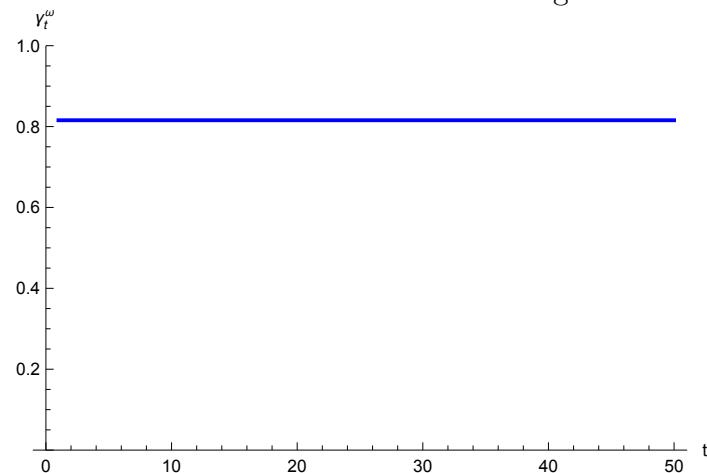

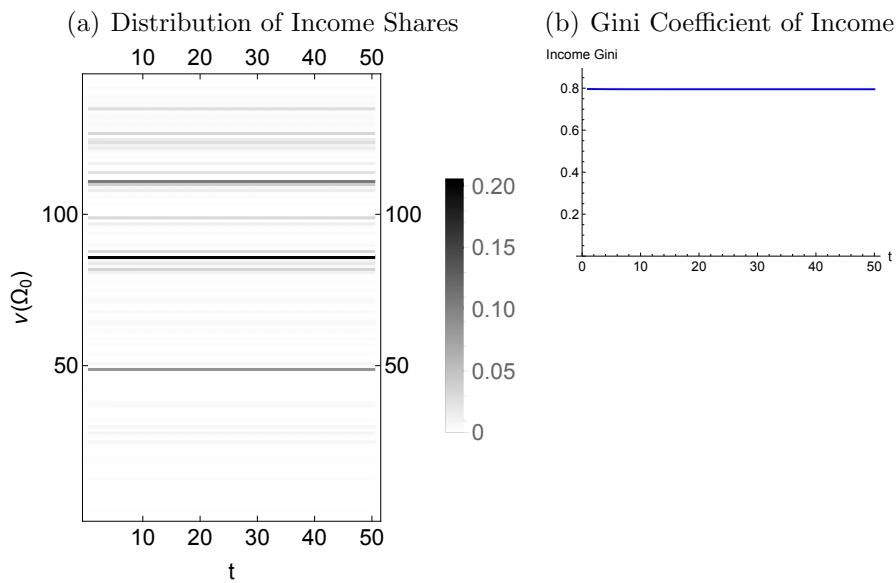

Figure 72: Distribution of Income - Model with exogenous technical change

## 6 Proxies for Human Capital

This section presents simulations using proxies for human capital for those countries without a measurement of human capital in the Penn World Table [2]. Countries with no data on human capital are assigned a proxy value of one and labour endowments are then specified as in the simulations reported in the paper. This expands the population of countries to  $N = 180$ , and all other parameters are the same as in the simulations of the main paper. The simulations with proxies for human capital are run for the basic scenario and the model with technical change in the main paper.

### 6.1 Proxies for Human Capital - Basic Model

Figure 73 reports the summary results.

Figure 74 shows the exploitation and class status of the agents over the course of the simulation.

Figure 75(a) shows the distribution of  $e_t^\nu$  across agents for all  $t$ . Figure 75(b) shows that the Gini coefficient of  $e_t^\nu$ .

Figures 76-78 show exploitation intensity versus initial wealth for all countries for  $t = 1$  to provide a sense of how countries fall into being exploiters or exploited. As in the basic model in the main simulations, countries' positions in the hierarchy of exploitation status do not change over  $t$ .

Tables 15 and 16 report  $e_t^\nu$  for exploiter and exploited countries, respectively, for  $t = 1$ , as in figures 76-78.

Figures 79 and 80 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

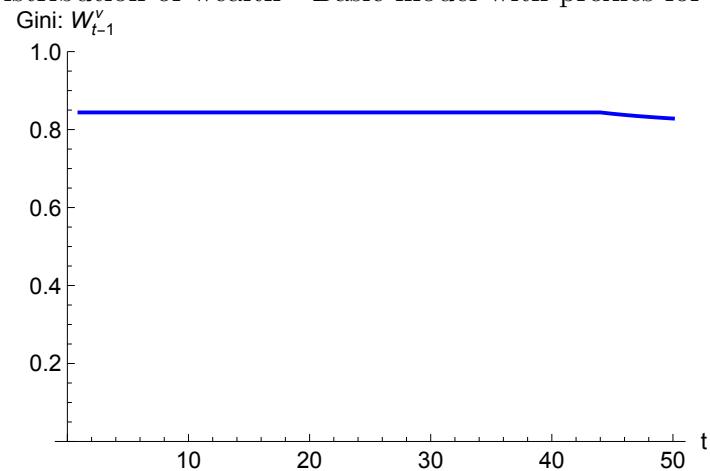

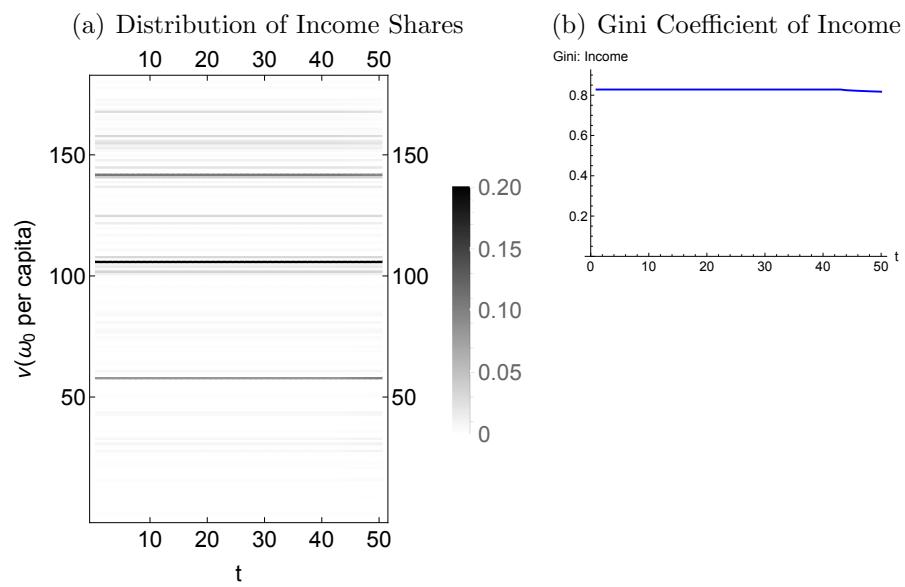

Figure 80: Distribution of Income - Basic model with proxies for human capital

## 6.2 Proxies for Human Capital - Model with exogenous technical change and endogenous consumption

This subsection presents results for the simulation with proxies for human capital and exogenous technical change and endogenous consumption.

Figure 83 shows the exploitation and class status of the agents over the course of the simulation.

Figure 84(a) shows the distribution of  $e_t^\nu$  across agents for all  $t$ . Figure 84(b) shows the Gini coefficient of  $e_t^\nu$ .

Figures 85-87 show exploitation intensity versus initial wealth for all countries for select  $t$ .

Tables 17 and 18 report  $e_t^\nu$  for exploiter and exploited countries, respectively, for the same select  $t$  as figures 85-87.

Figure 81: Summary results - Model with exogenous technical change using proxies for human capital

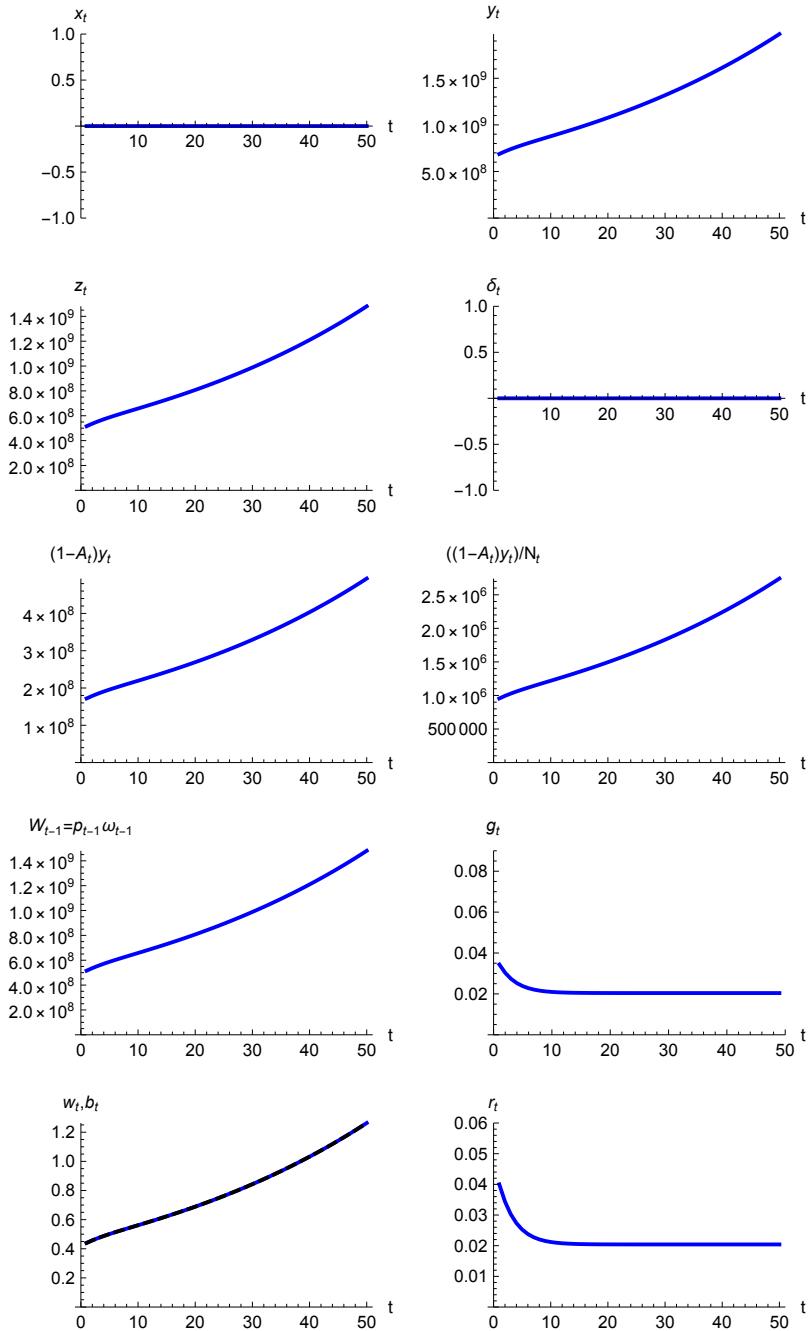

Figure 82:  $L_t$  and labour values - Model with exogenous technical change using proxies for human capital

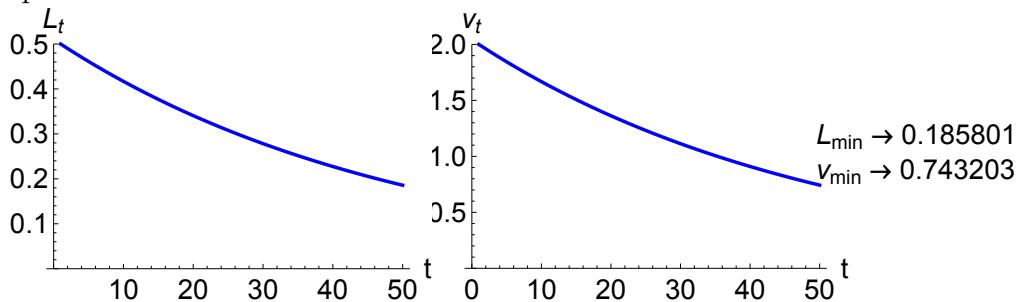

Figure 83: Class and exploitation status - Model with exogenous technical change using proxies for human capital

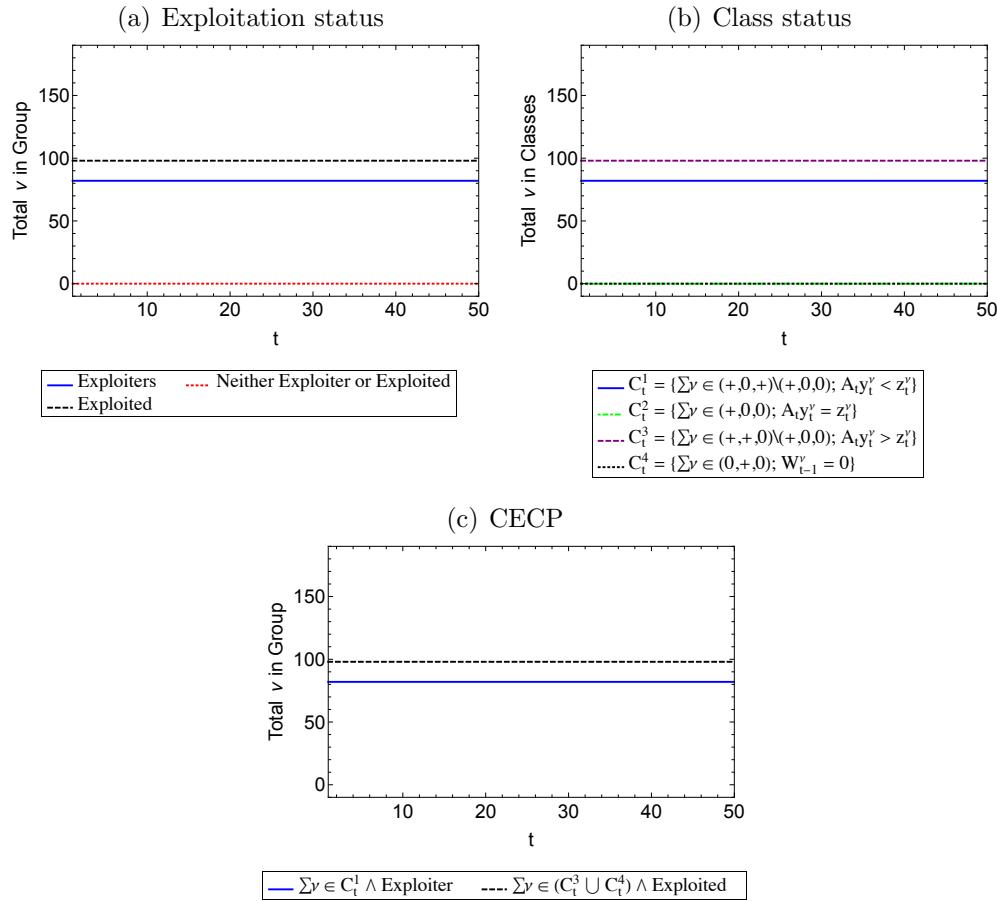

Figure 84: Exploitation intensity index - Model with exogenous technical change using proxies for human capital

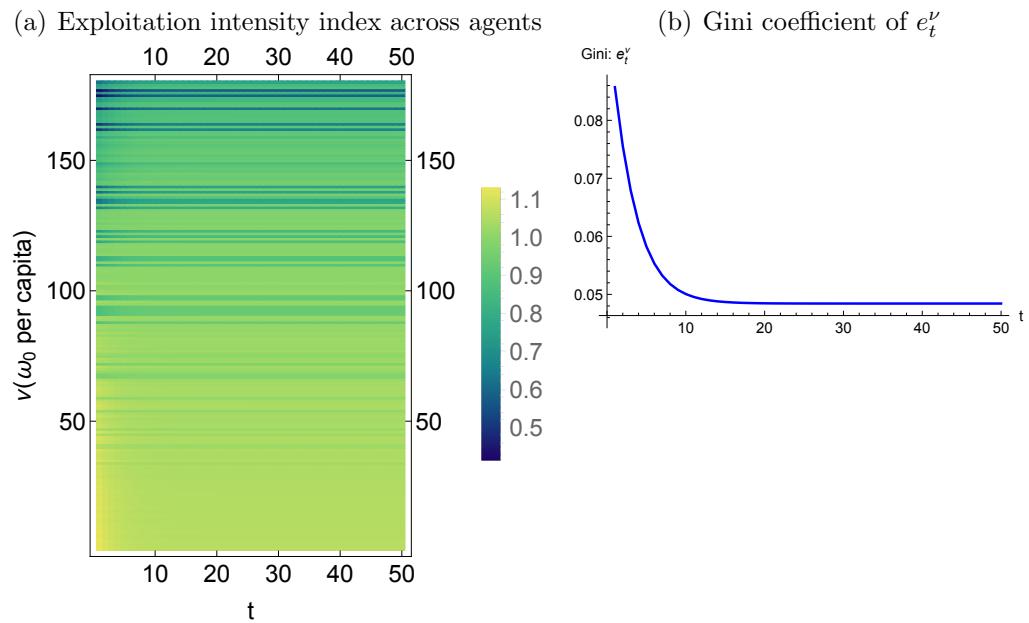

Figure 85: Worldwide Exploitation Intensity - Model with exogenous technical change using proxies for human capital

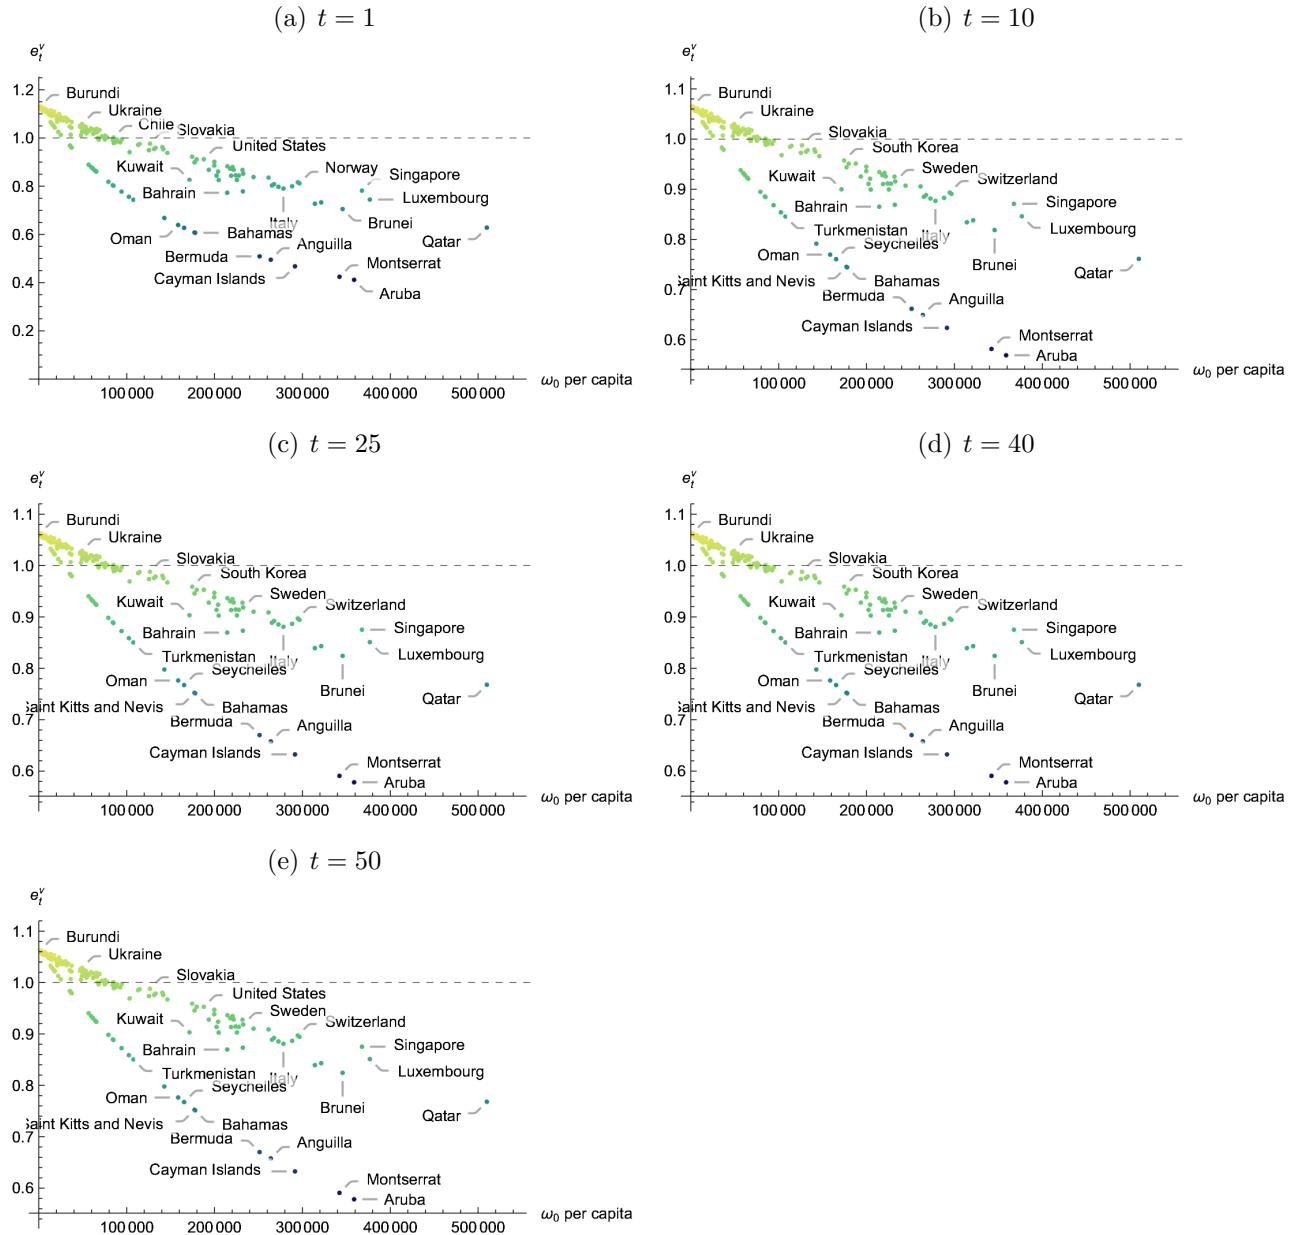

Figure 86: Exploiter Countries - Model with exogenous technical change using proxies for human capital

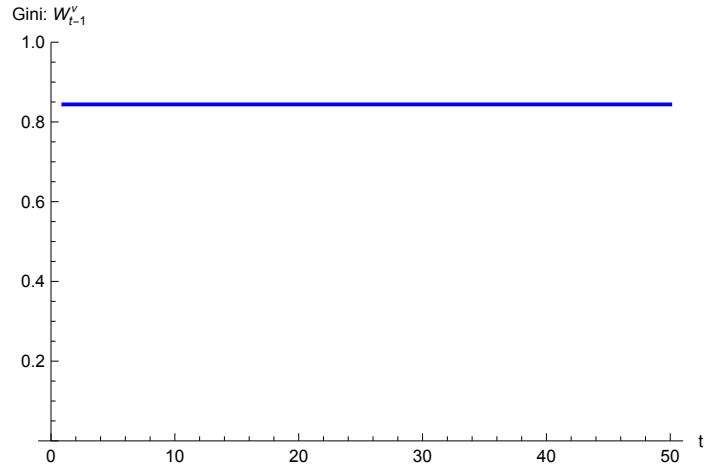

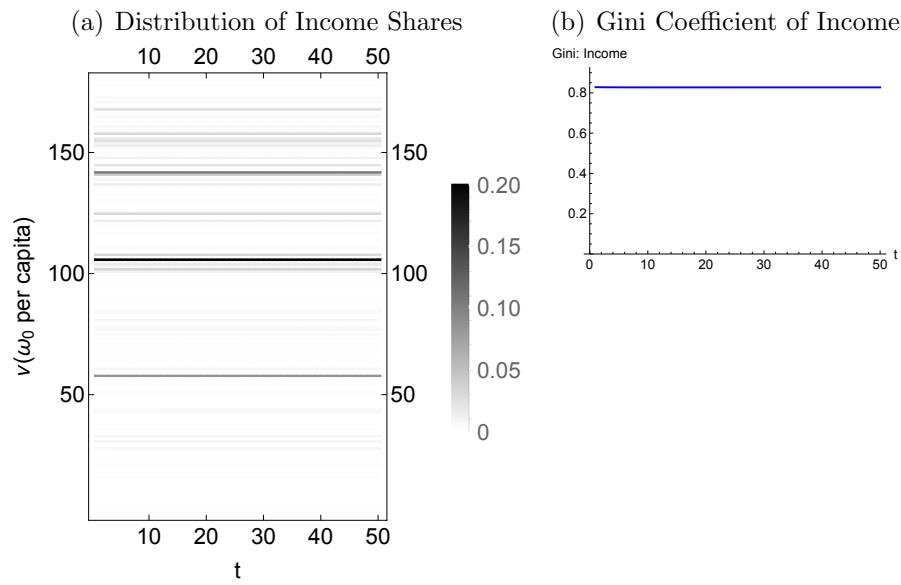

Figure 89: Distribution of Income - Model with exogenous technical change using proxies for human capital

### 6.3 Proxies for Human Capital - Model with endogenous technical change and consumption

This subsection presents results for the simulation with proxies for human capital and endogenous technical change and consumption.

Figure 92 shows the exploitation and class status of the agents over the course of the simulation.

Figure 93(a) shows the distribution of  $e_t^\nu$  across agents for all  $t$ . Figure 93(b) shows the Gini coefficient of  $e_t^\nu$ .

Figures 94-96 show exploitation intensity versus initial wealth for all countries for select  $t$ .

Tables 19 and 20 report  $e_t^\nu$  for exploiter and exploited countries, respectively, for the same select  $t$  as figures 94-96.

Figure 90: Summary results - Model with endogenous technical change and consumption using proxies for human capital

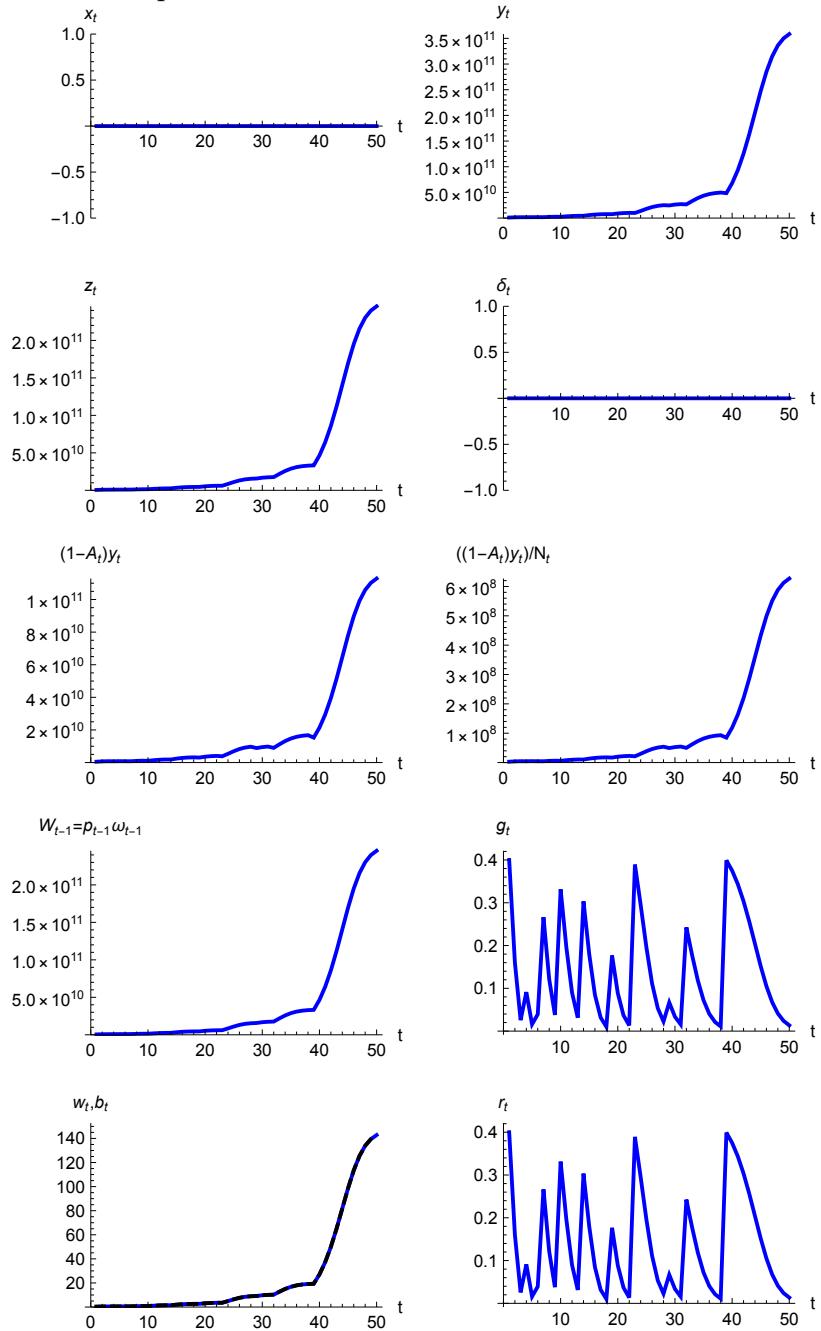

Figure 91:  $A_t$ ,  $L_t$ , and labour values - Model with endogenous technical change and consumption using proxies for human capital

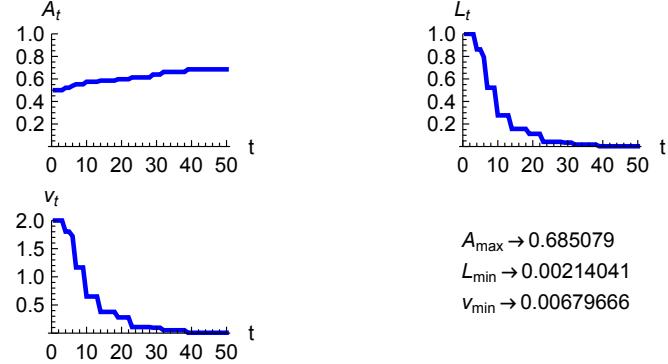

Figure 92: Class and exploitation status - Model with endogenous technical change and consumption using proxies for human capital

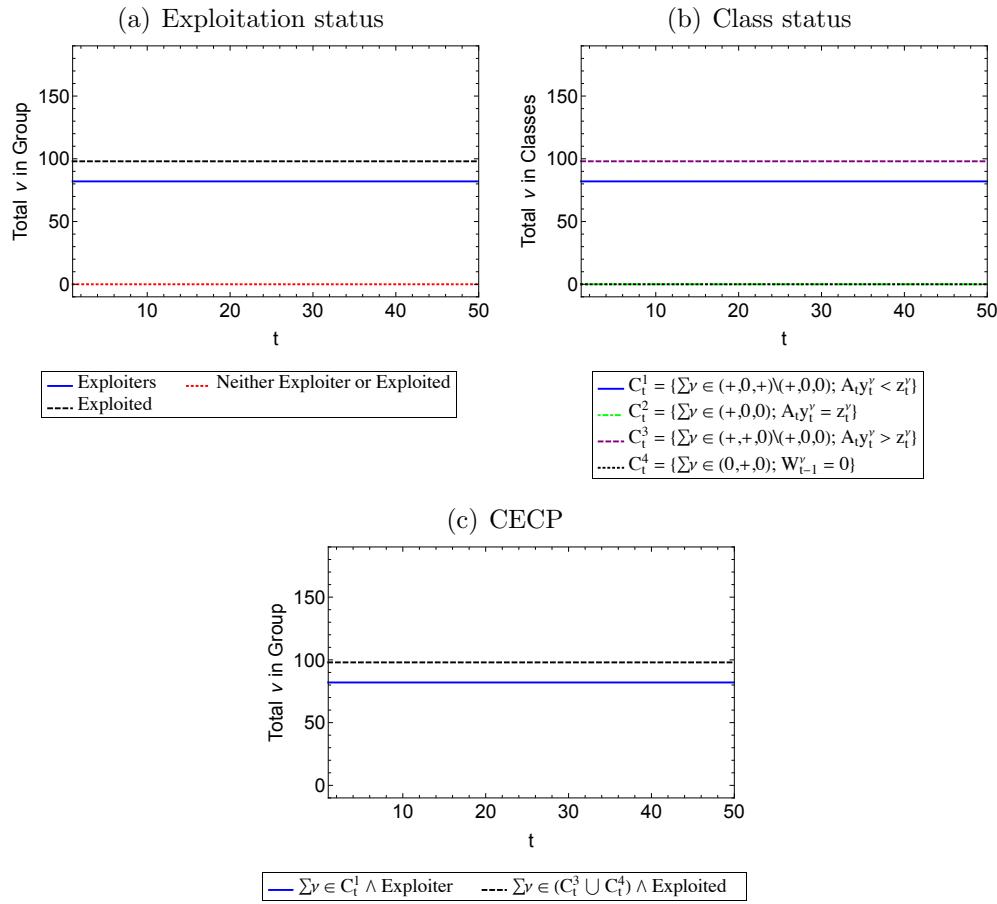

Figure 93: Exploitation intensity index - Model with endogenous technical change and consumption using proxies for human capital

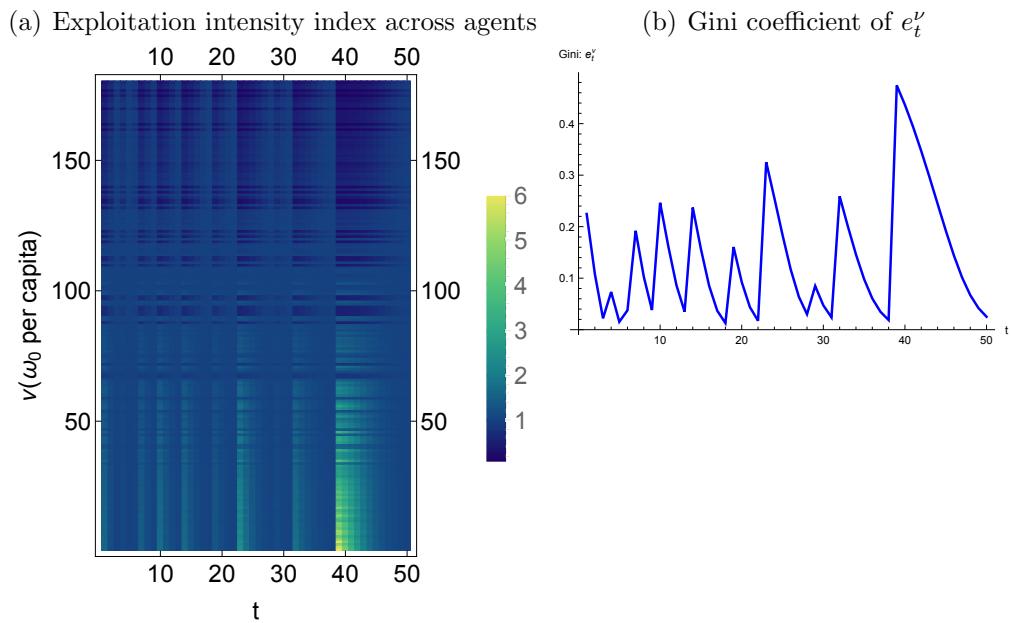

Figure 94: Worldwide Exploitation Intensity - Model with endogenous technical change and consumption using proxies for human capital

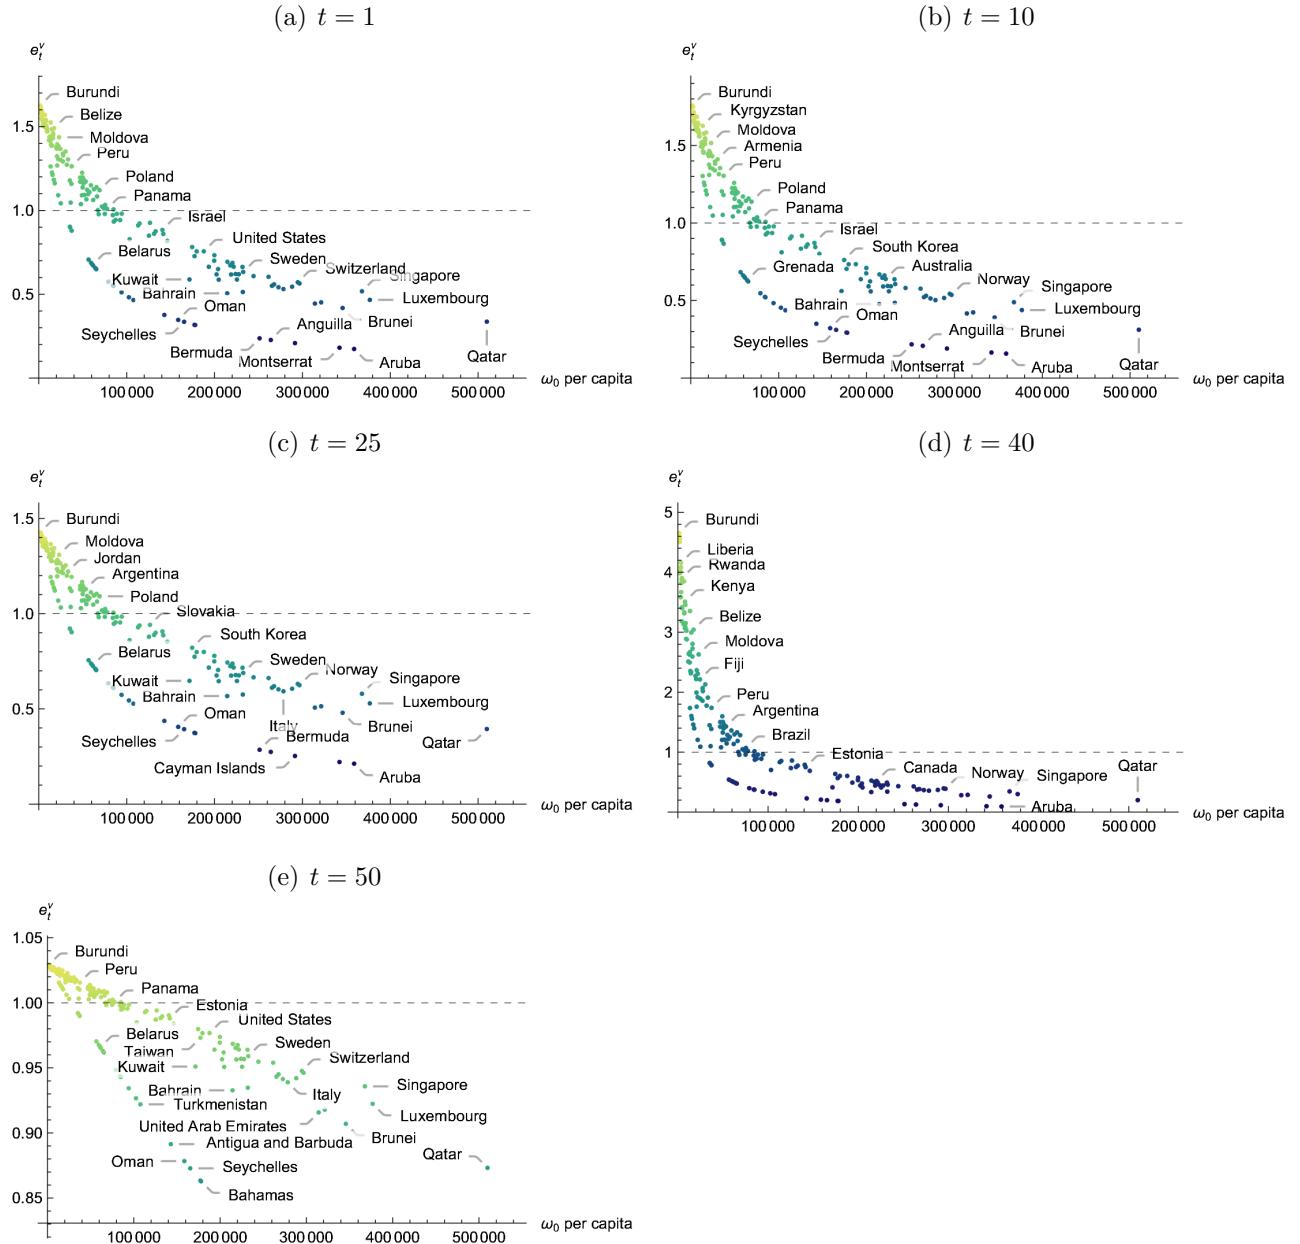

Figure 95: Exploiter Countries - Model with endogenous technical change and consumption using proxies for human capital

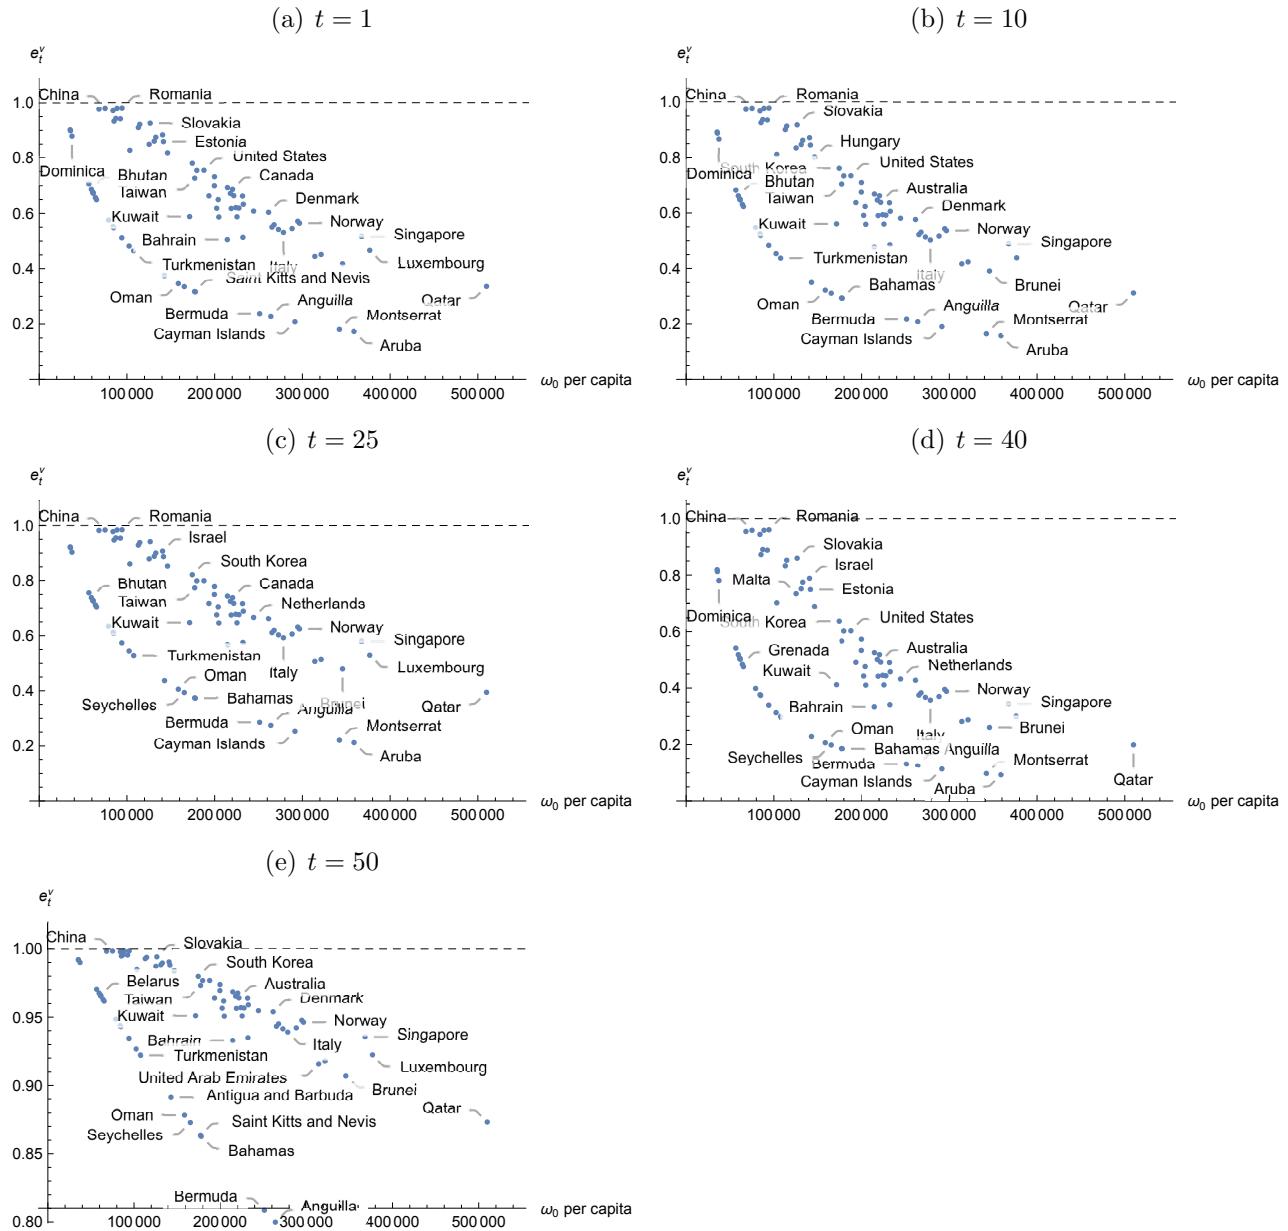

Figure 96: Exploited Countries - Model with endogenous technical change and consumption using proxies for human capital

Figures 97 and 98 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

Figure 97: Distribution of wealth - Model with endogenous technical change and consumption using proxies for human capital

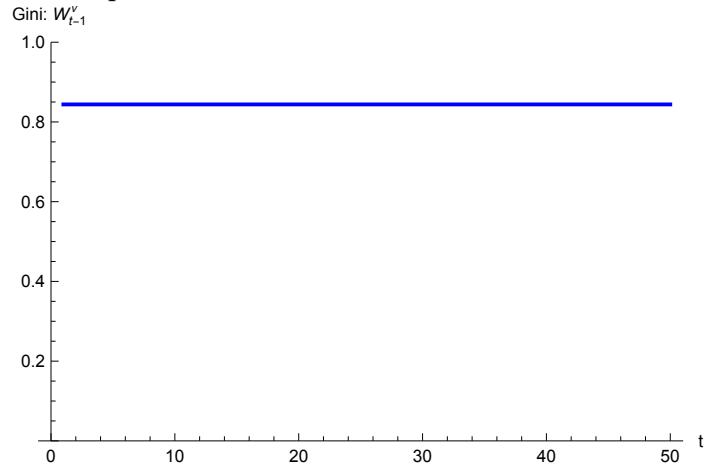

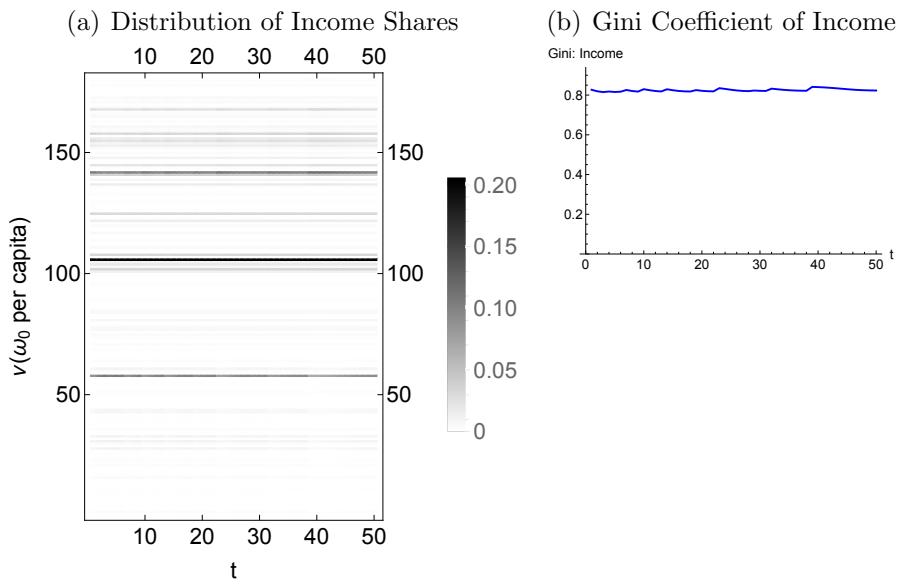

Figure 98: Distribution of Income - Model with endogenous technical change and consumption using proxies for human capital

## 7 Persons Engaged

This section presents results for simulations that use the Penn World Table [2] data on persons engaged to determine countries' labour endowments rather than population. The persons engaged in each country is multiplied by 1,000,000 to scale labour capacities to ensure the simulations begin from a capital constrained state. With the available data  $N = 171$  for this method of determining labour endowments. All other parameters are the same as the main simulations. This alternative specification of labour endowments is run for the basic model, the model with exogenous technical change and endogenous consumption, and the model with endogenous technical change and consumption.

### 7.1 Persons Engaged - Basic Model

Figure 99 reports the summary results.

Figure 100 shows the exploitation and class status of the agents over the course of the simulation.

Figure 101(a) shows the distribution of  $e_t^\nu$  across agents for all  $t$ . Figure 101(b) shows that the Gini coefficient of  $e_t^\nu$ .

Figures 102-104 show exploitation intensity versus initial wealth for all countries for  $t = 1$  to provide a sense of how countries fall into being exploiters or exploited. As in the basic model in the main simulations, countries' positions in the hierarchy of exploitation status do not change over  $t$ .

Tables 21 and 22 report  $e_t^\nu$  for exploiter and exploited countries, respectively, for  $t = 1$ , as in figures 102-104.

Figures 105 and 106 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

Figure 106: Distribution of Income - Basic model using persons engaged

## 7.2 Persons Engaged - Model with Exogenous Technical Change and Endogenous Consumption

This subsection presents results for the simulation using persons engaged to determine labour endowments with exogenous technical change and endogenous consumption.

Figure 109 shows the exploitation and class status of the agents over the course of the simulation.

Figure 110(a) shows the distribution of  $e_t^\nu$  across agents for all  $t$ . Figure 110(b) shows the Gini coefficient of  $e_t^\nu$ .

Figures 111-113 show exploitation intensity versus initial wealth for all countries for select  $t$ .

Tables 23 and 24 report  $e_t^\nu$  for exploiter and exploited countries, respectively, for the same select  $t$  as figures 111-113.

Figure 107: Summary results - Model with exogenous technical change using persons engaged

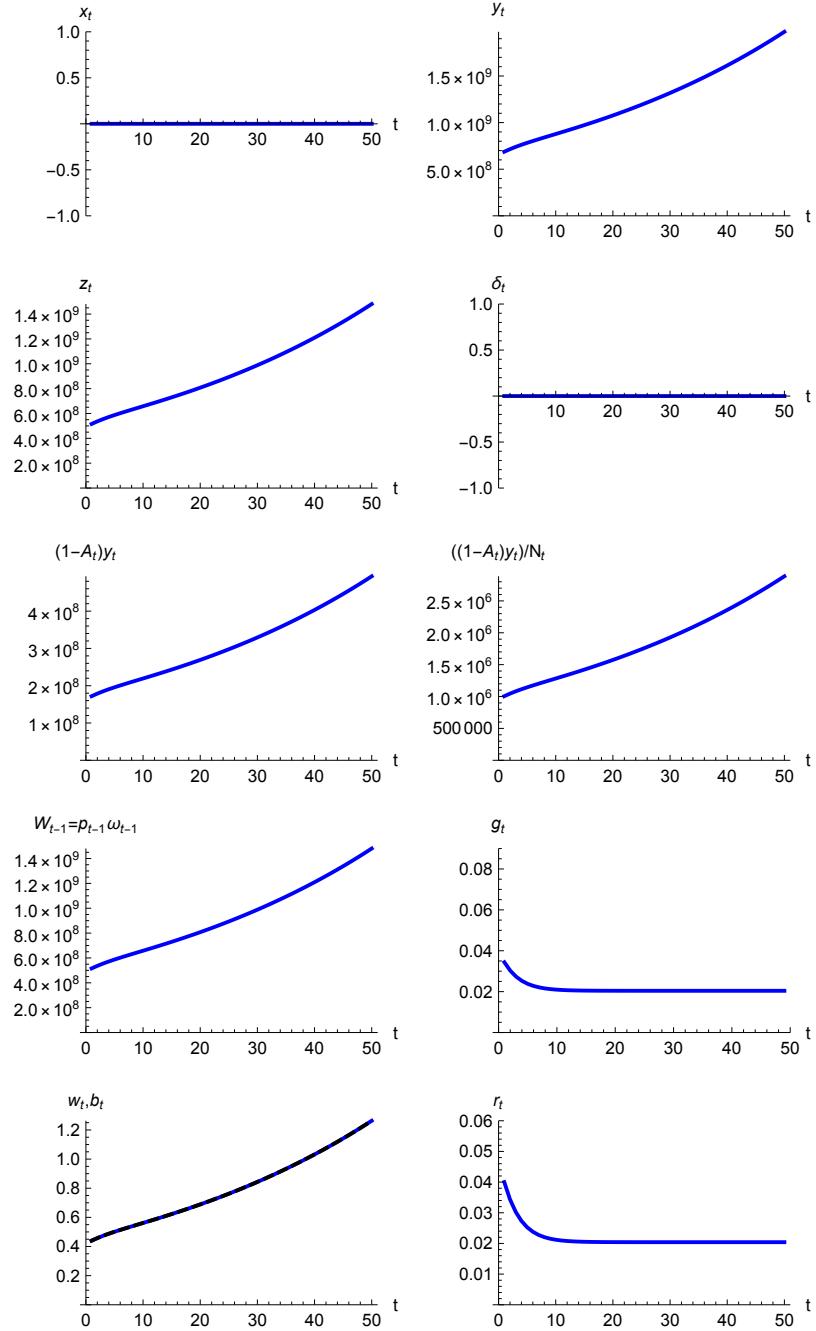

Figure 108:  $L_t$  and labour values - Model with exogenous technical change using persons engaged

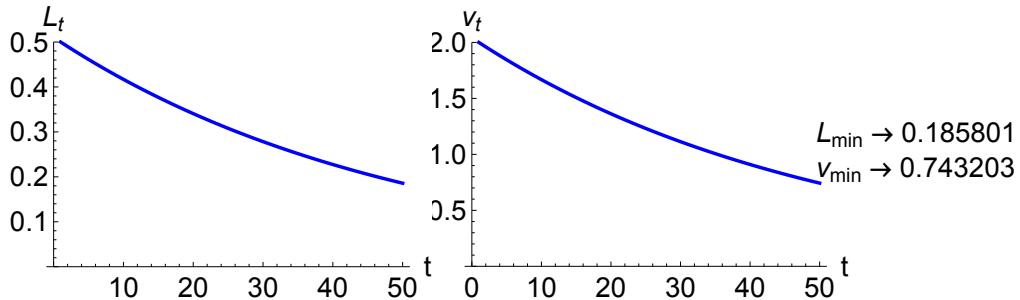

Figure 109: Class and exploitation status - Model with exogenous technical change using persons engaged

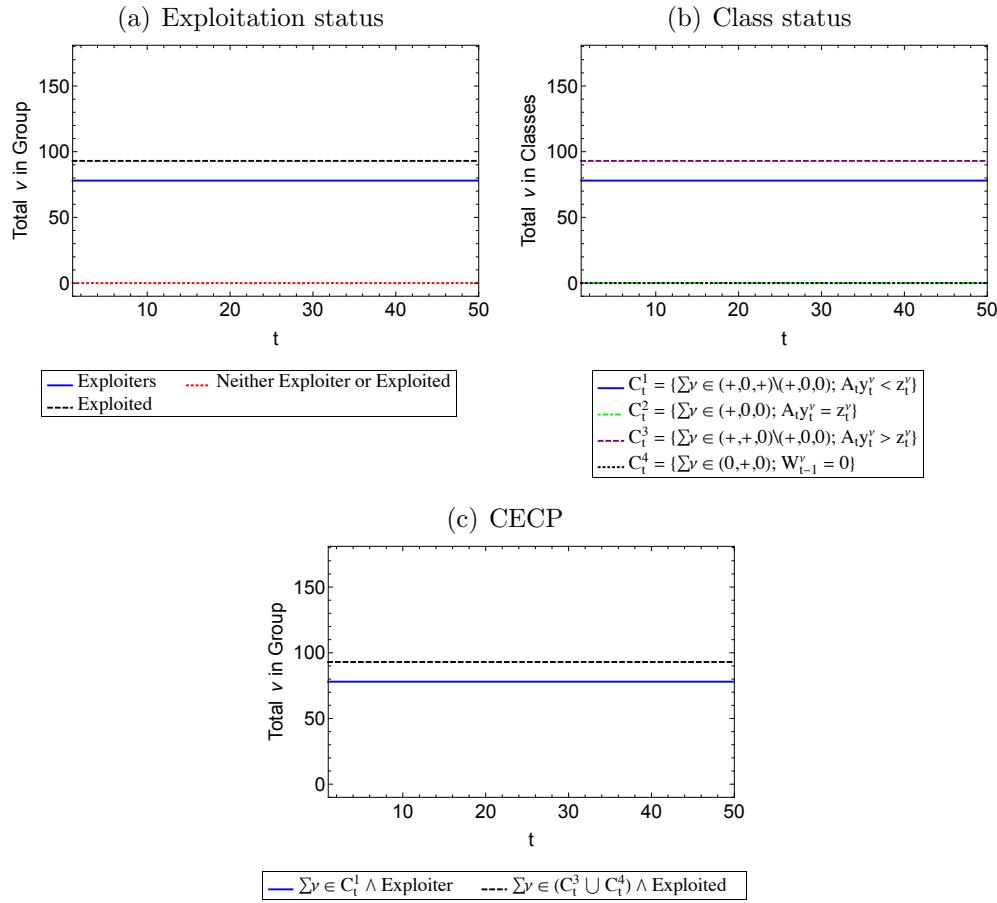

Figure 110: Exploitation intensity index - Model with exogenous technical change using persons engaged

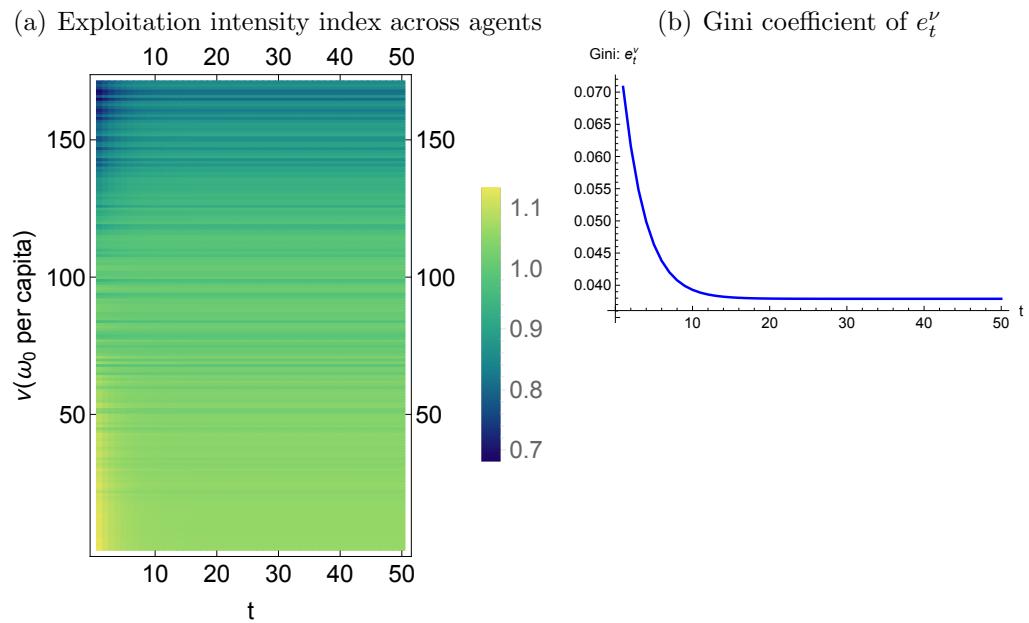

Figure 111: Worldwide Exploitation Intensity - Model with exogenous technical change using persons engaged

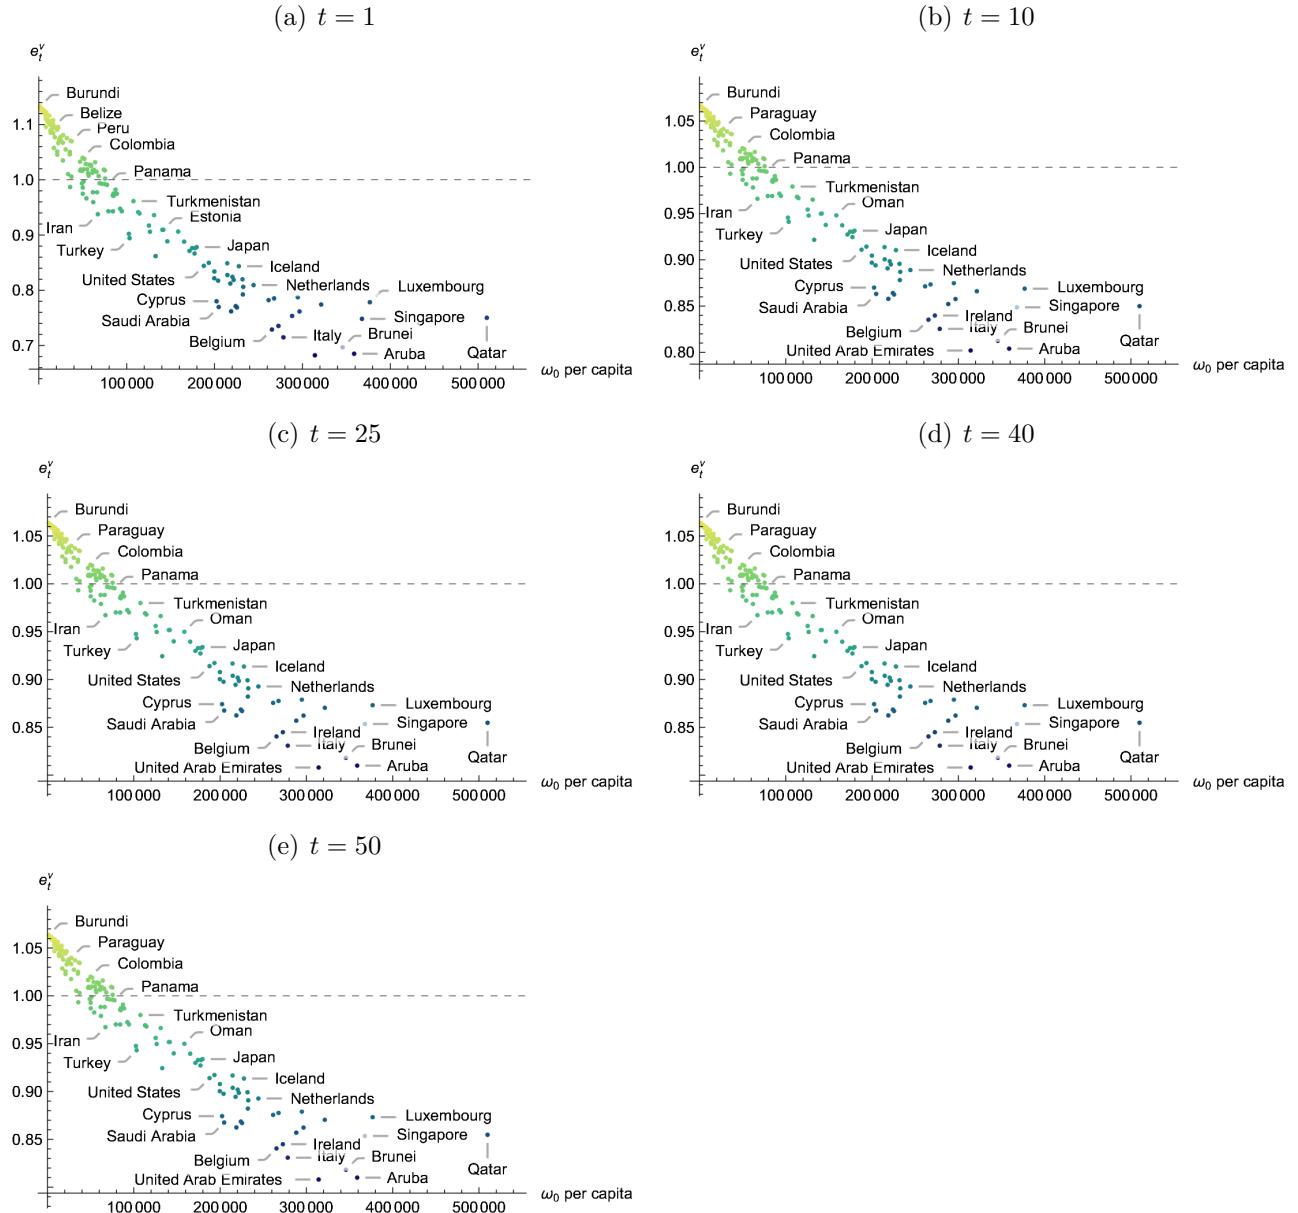

Figure 112: Exploiter Countries - Model with exogenous technical change using persons engaged

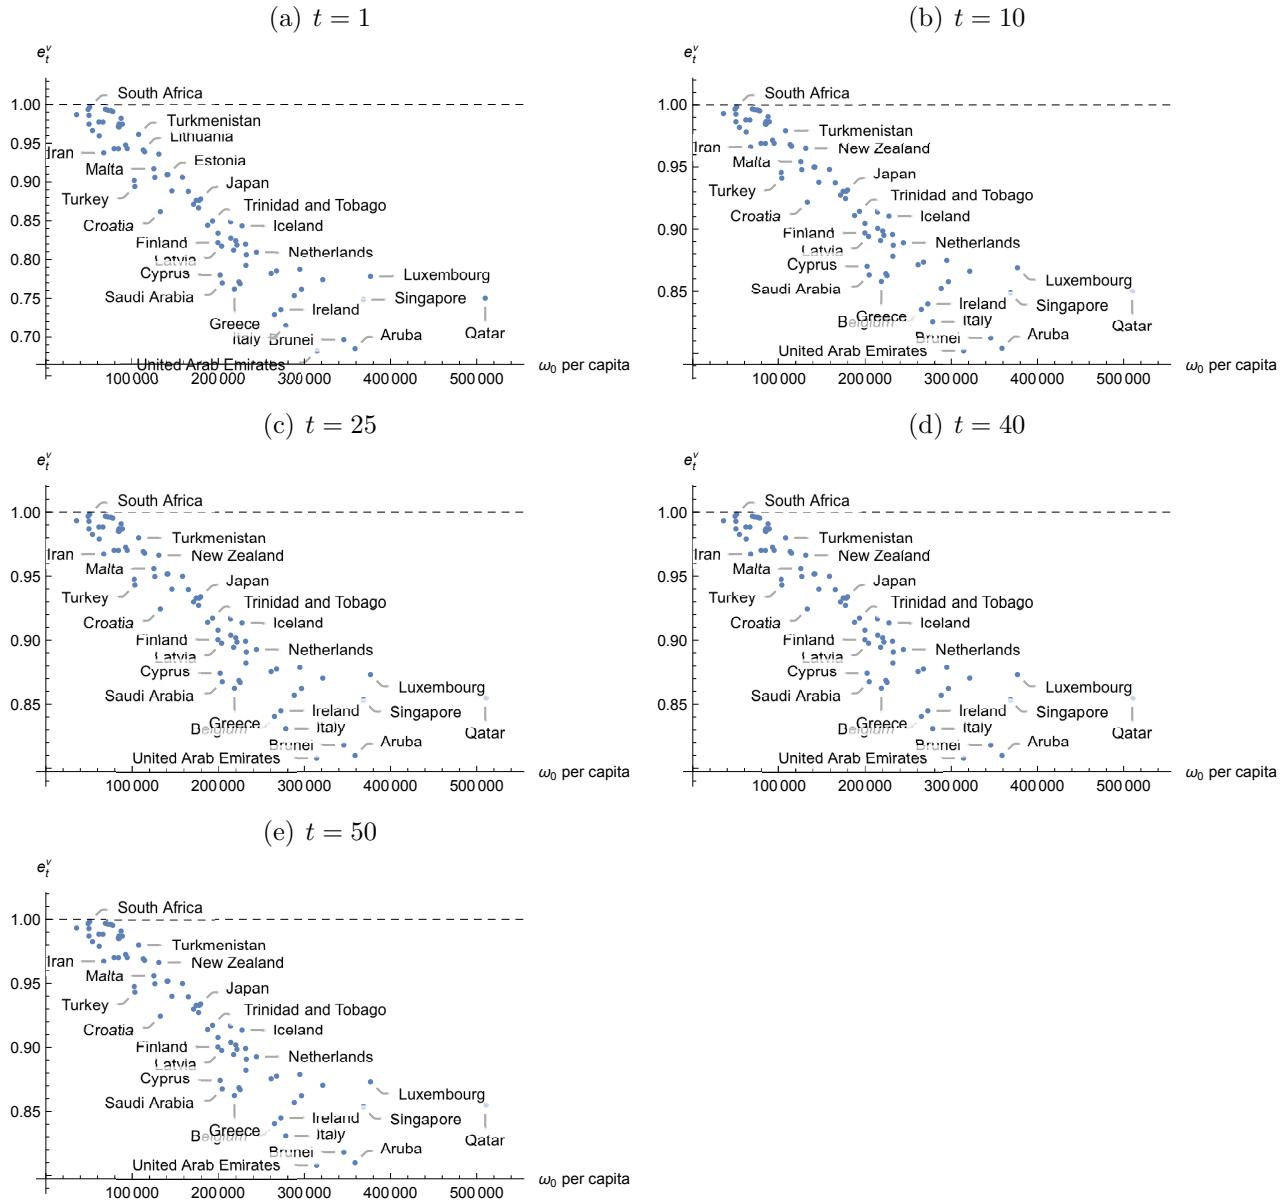

Figure 113: Exploited Countries - Model with exogenous technical change using persons engaged

Figures 114 and 115 show the Gini coefficients of the distributions of wealth and income and the distribution of income shares over  $t$ .

Figure 114: Distribution of wealth - Model with exogenous technical change using persons engaged

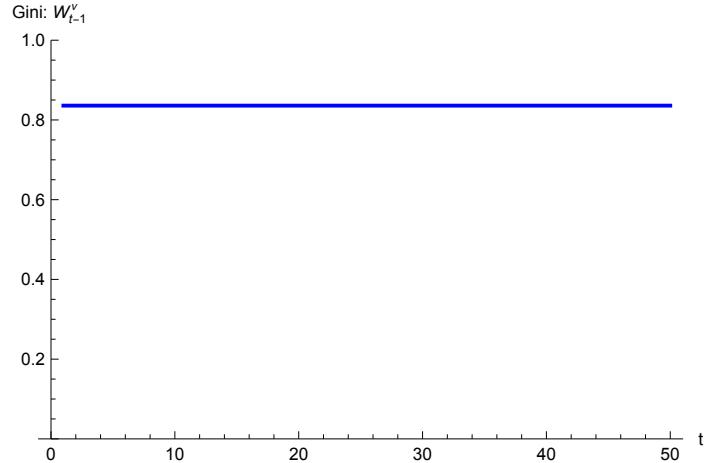

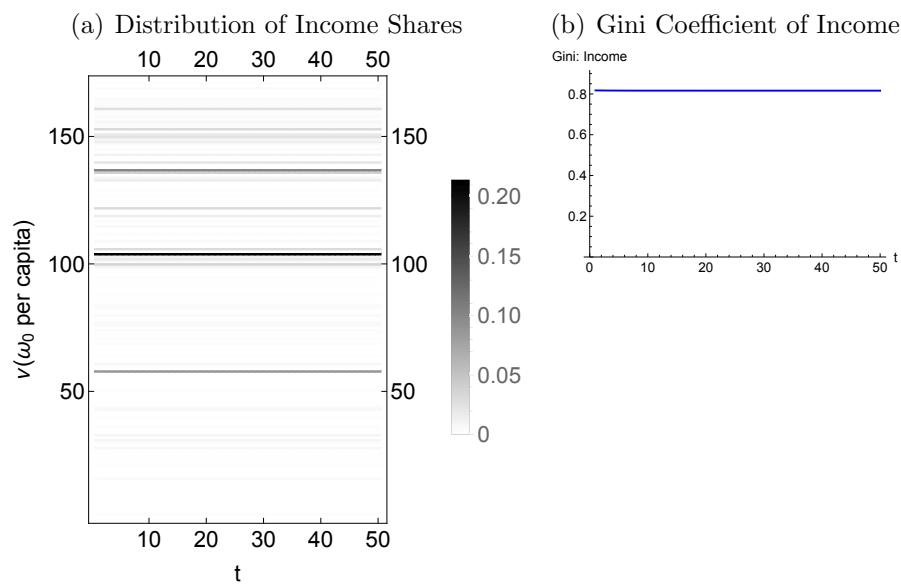

Figure 115: Distribution of Income - Model with exogenous technical change using persons engaged

### 7.3 Persons Engaged - Model with endogenous technical change and consumption

This subsection presents results for the simulation using persons engaged to determine labour endowments with endogenous technical change and consumption.

Figure 118 shows the exploitation and class status of the agents over the course of the simulation.

Figure 119(a) shows the distribution of  $e_t^\nu$  across agents for all  $t$ . Figure 119(b) shows the Gini coefficient of  $e_t^\nu$ .

Figures 120-122 show exploitation intensity versus initial wealth for all countries for select  $t$ .

Tables 25 and 26 report  $e_t^\nu$  for exploiter and exploited countries, respectively, for the same select  $t$  as figures 120-122.

Figure 116: Summary results - Model with endogenous technical change and consumption using persons engaged

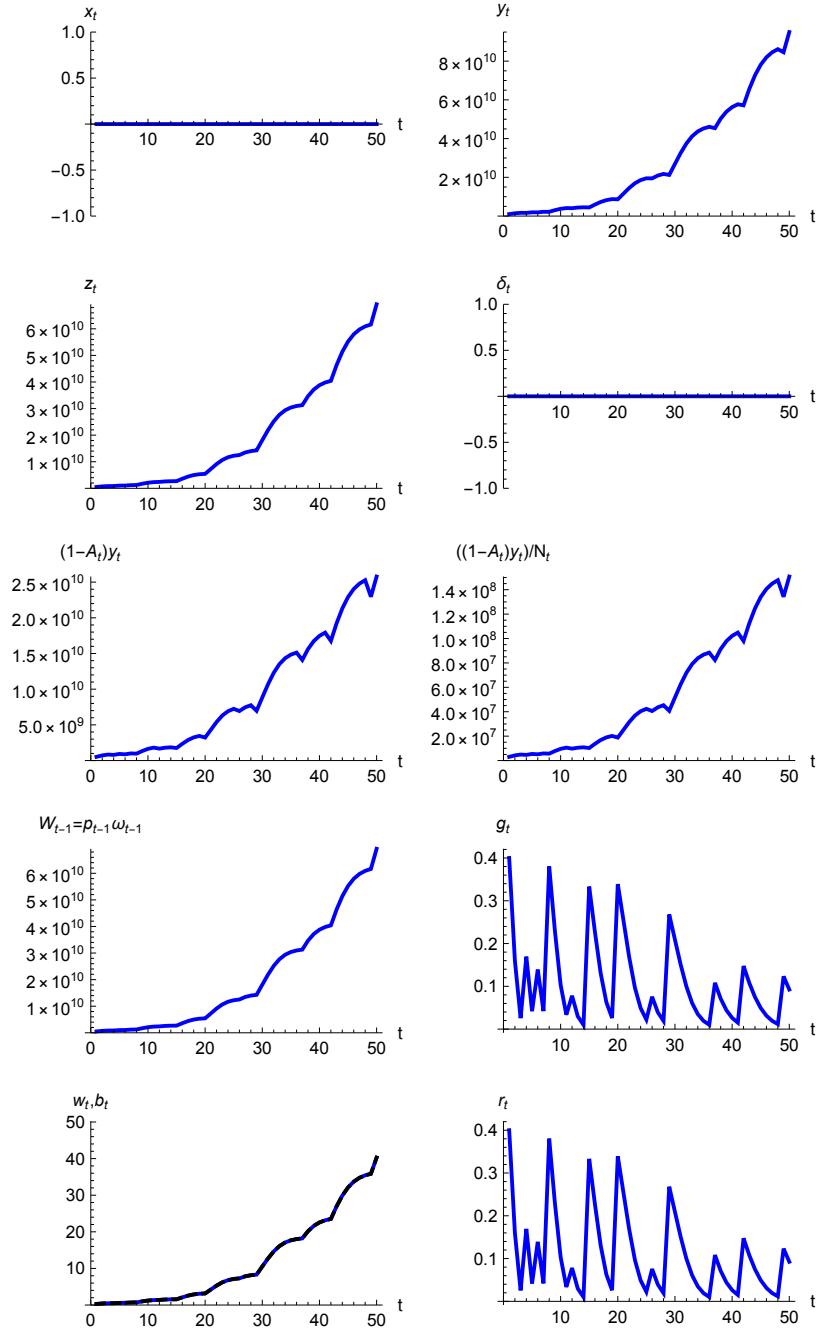

Figure 117:  $L_t$  and labour values - Model with endogenous technical change and consumption using persons engaged

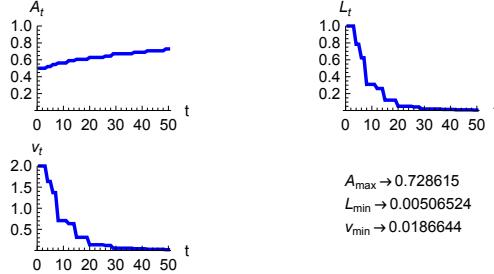

Figure 118: Class and exploitation status - Model with endogenous technical change and consumption using persons engaged
